Jedan od najvećih problema u realizaciji sustava upravljanja gibanjem preko komunikacijske mreže jest kašnjenje u prijemu podataka. To kašnjenje dovodi do narušavanja svojstava sustava upravljanja gibanjem, a može ga učiniti i nestabilnim. Za kompenzaciju kašnjenja u radi se predlaže modificirani rekonstruktor poremećaja zasnovan na Smithovu prediktoru. Predloženi rekonstruktor omogućuje izvedbu robusnog sustava upravljanja gibanjem s dva stupnja slobode. Valjanost predložene sustava potvrđena je ekspertmentalno na sustavu upravljanja pozicijom linearnog motora preko komunikacijske mreže. Dobiveni rezultati pokazuju robusno vladanje predložene sustava u uvjetima promjenjivog kašnjenja prijema podataka preko mreže i pri djelovanju vanjske sile.</p> <p>(Sl. 11, Tab. 2, Lit. 12 – original na engleskom)</p> <p><i>Autori</i></p> <p>upravljanje gibanjem sustav upravljanja preko mreže rekonstrukcija signala linearni motor</p> <p>ATM/TKA 987</p> <p>UDK 004.822:681.515 629.5:004.822 IFAC 3.2.1:5.7.4 Izvorni znanstveni članak</p> <p>AUTOMATIKA 47(1-2),19-30(2006)</p> <p>ALGORITAM ZA SPREĆAVANJE ZASTOJA TEMELJEN NA UZASTOPNOJ KONTROLI SIFONA PETRIJEVE MREŽE</p> <p><i>Doc. dr. Damir Kezić</i> Faculty of Maritime Studies, Dept. of El. Eng. University of Split, Zrinsko-Frankopanska 38, 21000 Split, Croatia E-mail: damirkezić@pfst.hr; WWW: http://www.pfst.hr</p> <p><i>Prof. dr. Predloženi algoritam koristi stabilno dinamično stanja za detekciju stanja zastaja i metodu uzastopne kontrole sifona za sintezu nadzornika za sprećavanje zastaja. Nadzornik je najviše dopunjuje i sadrži najmanji broj kontrolnih mjesta. Algoritam je namijenjen za reverzibilne ili djelomično reverzibilne Pet Petrijeve mreže, ali se može koristiti i za obične Petrijeve mreže. Proračun nadzornika pokazan je na dva primjera. Prvi primjer prikazuje sintezu nadzornika za sprećavanje zastaja u fleksibilnom proizvodnom sustavu s tri robota i tri proizvodne trake, gdje se zastoj može dogoditi zbog međusobnog natjecanja transportnih traka za angažiranje robota te zbog nepredvidljivosti trajanja tih angažiranja. Drugi primjer prikazuje sintezu nadzornika u pomorskom prometnom sustavu, gdje se opasne situacije zastaja plovlia mogu dogoditi poradi neodgovarajućeg pomicanja plovlia kroz sustav. Da bi se to izbjeglo, promet plovlia se nadzire i upravlja pomoću vještinske signalizacije korištenjem nadzornika za sprećavanje zastaja, koji je odgovoran za zadržavanje plovlia samo u situaciji opasnog stanja te dok to stanje ne nestane.</p> <p>(Sl. 10, Tab. 2, Lit. 9 – original na engleskom)</p> <p><i>Autori</i></p> <p>nadzornik za sprećavanje zastaja Petrijeva mreža, kontrola sifona</p> <p>ATKAAF 47(1-2),19-30(2006)</p> <p>ISSN 0005-1144</p>	<p>ATM/TKA 986</p> <p>UDK 681.53 IFAC 2.6:2.5:3.1 Izvorni znanstveni članak</p>	<p>AUTOMATIKA 47(1-2),11-18(2006)</p> <p>PROJEKTIRANJE UPRAVLJANJA MEHATRONIČKOG SUSTAVA ZASNOVANO NA DINAMIČKOM OPONASNJU MEHANIČKOG TERETA</p> <p><i>M. Rodič, K. Jezernik, M. Trlep</p> <p>The paper presents and analyses rapid prototyping methods for the dynamic emulation of mechanical loads. Approaches can be applied in design, testing and validation of the mechatronic systems propelled by electric drives. Actual system (prototype) is replaced by the torque controlled electro-mechanical load for which the required torque is calculated through the closed-loop control algorithm. The active load is connected mechanically to the drive shaft, using the clutch. Also possible applications in the control design for variable speed and torque drives are described. For the illustration of the method emulation of the pump mechanism is given.</p> <p>(Fig. 17, Ref. 12 – original in English)</p> <p><i>Authors</i></p>	<p>ISSN 0005-1144 ATKAAAF 47(1-2),11-18(2006)</p>	<p>ATM/TKA 985</p> <p>UDK 621.308:621.313 IFAC 4.3.2.5.8.6 Original scientific paper</p> <p>AUTOMATIKA 47(1-2),5-10(2006)</p> <p>Robust Network Motion Control System Based on Disturbance Observer</p> <p><i>Keio University, Yokohama, Japan</i> Atsushi Kato, Akhali Mirza, Kazuki Ohnishi E-mail: atsushi@ams.s.kitaca.ac.jp; mirza@ams.s.kitaca.ac.jp; ohnishi@scl.kitaca.ac.jp</p> <p>The aim of this paper is to realize robust network motion control system. One of the most significant issues for network motion control realization is time delay during transmission. Obviously, most time delay systems are unstable. Additionally, time delay may cause control performance degradation in motion control system. In this paper, a modified disturbance observer with Smith predictor is proposed to compensate time delay. This modification realizes a robust two-degree-of-freedom control system over network. The serial compensation of Smith predictor is utilized to compensate time delay. The validity of the proposed method is confirmed by the position control of linear motor over network experimentally. Experimental results show that the proposed control system has robustness against transmission delay fluctuation over network and external force.</p> <p>(Fig. 11, Tab. 2, Ref. 12 – original in English)</p> <p><i>Authors</i></p>

Due to the transformer leakage inductance the converter suffers from the voltage spikes, which can be "controlled" by the dissipative RCD or non-dissipative LCD clamp circuits. Both of the clamp circuits consist of the diode. The diode reverse recovery charge causes the oscillation, which results in additional dissipation of the clamp circuitry. This paper describes this ringing phenomenon and the use of an RC-RCD clamp circuit for damping the clamp-diode's oscillation. This clamp circuit is capable for improving a flyback converter's power ratio.</p> <p>(Fig. 17, Ref. 6 – original in English)</p> <p><i>Authors</i></p>	<p>ISSN 0005-1144 ATKAAAF 47(1-2),31-37(2006)</p>	<p>ATM/TKA 987</p> <p>UDK 004.822:681.515 629.5:504.8522 IFAC 3.2.15.7.4 Original scientific paper</p> <p>AUTOMATIKA 47(1-2),19-30(2006)</p> <p>AN ALGORITHM FOR DEADLOCK PREVENTION BASED ON ITERATIVE SIPHON CONTROL OF PETRI NET</p> <p><i>Doc. dr. Dunčo Kezić</i> <i>Faculty of Maritime Studies, Department of EI, Eng. University of Split, Zrinske Frankopanceva 38, 21000 Split, Croatia</i> E-mail: duncko.kezic@pfst.hr; MNM: http://www.jgk.hr E-mail: nedjelko.percec@fer.hr; MNM: http://www.fer.hr/dpdr ivan.petrovic@fer.hr; MNM: http://www.fer.hr/dpdr</p> <p>This paper presents a formal calculation method of a deadlock prevention supervisor by the use of Petri nets. The proposed algorithm uses reachability tree to detect deadlock state and iterative siphon control method to synthesize the deadlock prevention supervisor. Such supervisor is maximally permissive and consists of minimal number of control places. The algorithm is intended for reversible or partially reversible P-T Petri net, but it can also be applied to Ordinary Petri nets. The calculation of the supervisor is illustrated by two examples. The first example shows the synthesis of deadlock prevention supervisor in a manufacturing system consisting of three conveyors and three robots, where the deadlock can occur due to concurrent requests of the conveyors for the robot engagements and unpredictable duration of those engagements. The second example shows the synthesis of deadlock prevention supervisor in a marine traffic system, where dangerous vessel deadlock situations may occur in case of vessels' irregular motion through the system. To avoid this, the vessel traffic is supervised and controlled by traffic lights using the deadlock prevention supervisor, which is responsible for vessels' stopping only in the case of dangerous situation and until this situation elapses.</p> <p>(Fig. 10, Tab. 2, Ref. 9 – original in English)</p> <p><i>Authors</i></p>

Metoda se sastoji od dvije glavne cjeline: a) predikcije potrebnog broja aktivnih ventilatora; i b) neizravnog upravljanja raznom zagađenju zraka u tunelu. Na osnovi njezina vremenskih uvjeta i intenziteta prometa kroz tunel, te poznatih parametara tunela, obavlja se predikcija proizvodnje ugljikovih monoksida, dušikovih oksida i krutih čestica iz ispuha vozila. Te predviđene količine zagađenja se u nastavku koriste za proračun prihvatljivosti zraka, tj. potrebne brzine strujanja zraka kroz tunel. Broj ventilatora s ukupnim pouzdanjem dovoljnim da se postigne to strujanje određuje se iz ravnoteže sile koje utječu na zračnu masu u tunelu. Isodobno, neizravni regulator uspostavlja mjerenje i zadanu vrijednost zagađenja, te podstavlja proračunat broj ventilatora kako bi održao stupanj uzastopne ispravnosti dopuštenih granica. Predložena metoda upravljanja ispitana je simulacijom uz usporedbu s metodom upravljanja koja je dosad korištena u tunelu Učka, a potom su dani rezultati stvarne implementacije predstavljenih metode upravljanja na tunelu Učka.</p> <p>(Sl. 18, Tab. 3. <p>THE ACOUSTIC ECHO CANCELLATION HANDS-FREE COMMUNICATOR <i>Mladen Madetić, Dubravko Milković</i> Faculty of Electrical Engineering and Computing, University of Zagreb, Unska 3, 10000 Zagreb, Croatia</p> <p>The control of acoustic feedback has an important function in speech processing systems, whenever the microphone picks up the audio signal radiated by loudspeaker and its reflection from the enclosure. The users are annoyed by listening to their own speech delayed by the round-trip time of the hands free communication. This paper compares properties of two FIR filter adaptation algorithms used in echo cancellation. Beside base algorithms, advanced and improved versions that include adaptive step size are considered. <i>(Fig. 16, Ref. 6 – original in English)</i></p> <p><i>Authors</i></p>	<p>MODEL PREDICTIVE FUZZY CONTROL OF LONGITUDINAL VENTILATION SYSTEM IN A ROAD TUNNEL <i>Stjepan Bogdan, Bruno Brnjac</i> University of Zagreb, Faculty of Electrical Engineering and Computing, Unska 3, 10000 Zagreb, Croatia http://hpcgcmzmp.fel.hr</p> <p>In this paper we describe a control method for longitudinal ventilation of road tunnels. The method consists of two main elements: a) prediction of a number of jet fans and b) fuzzy control of pollutant levels. Based on measurements of traffic intensity and weather conditions and by knowing tunnel parameters, production of CO, NOx and small particles (soot) is predicted. Estimated values of pollutants are then used for calculation of fresh air volume demand, i.e. required air flow is determined. One dimensional force equation is used for estimation of a number of jet fans that would produce a thrust force sufficient to provide calculated air flow. In the same time a fuzzy controller compares measured and requested levels of pollutants and adjusts a predicted number of jet fans in order to keep the pollutant levels within predefined boundaries. The proposed method is tested by simulation and obtained results are compared with a method which was previously used in the ventilation system of the tunnel Učka. Finally, the field results from the proposed control method implementation in the tunnel Učka are presented. <i>(Fig. 18, Tab. 3, Ref. 7 – original in English)</i></p> <p><i>Authors</i></p>		
<p>CODING STRATEGIES FOR COCHLEAR IMPLANTS <i>Brunko Šamk, Sinisa Ritić</i> Faculty of Electrical Engineering and Computing, Unska 3, HR-10000 Zagreb, Croatia <i>Ana Đembić, Mladen Ivković</i> Zagreb University Clinical Hospital Centre, Salata 4, HR-10000 Zagreb, Croatia <i>Jasmina Okrojić</i> Ministry of Labor and Social Welfare, Privošnje 14, HR-10000 Zagreb, Croatia</p> <p>The application of cochlear implants in the correction of hearing and speech impediments in deaf persons is known more than 25 years. This paper compares 3 different speech-coding strategies. These are the multiplex (MPEAK) coding strategy, the new spectral-peak (SPEAK) coding strategy and the high-rate continuous interleaved sampling (CIS) coding strategy. Results of several investigations show that the SPEAK and CIS coding strategies, based on spectral signal analysis, allow for better speech understanding in quiet as well as in noise, than MPEAK coding strategy, which relies on speech feature extraction. <i>(Fig. 6, Ref. 4 – original in English)</i></p> <p><i>Authors</i></p>	<p>ADSL ANALOG FRONT END <i>Doc. dr. sc. Nino Stojković, assistant professor</i> University of Rijeka, Faculty of Engineering, Vukovarska 58, HR-51000 Rijeka, Croatia</p> <p>In this paper the Asymmetric Digital Subscriber Line (ADSL) analog front end (AFE) designs are described and compared. AFE is the part of ADSL modems most responsible for quality signal transmission over phone wires. It can be divided into the transmitting path (TX) circuitry, the receiving path (RX) circuitry and the hybrid network and transformer. The operations and realizations of each functional block are presented. There are the D/A converter, the filter and the line driver in the TX path and the voltage gain amplifier, the filter and the A/D converter in the RX path. The hybrid network and transformer process signals in both directions. Different fabrication technologies are used for the practical realizations of the AFE chip. The directions of the further developing are notified. <i>(Fig. 9, Tab. 6, Ref. 39 – original in English)</i></p> <p><i>Author</i></p>
