

**ASS. SAXIFRAGO TRIDACTYLITI – HORNUNGIETUM
PETREAEE IZCO 1974 (TRACHYNION DISTACHYAE)
IN THE VEGETATION OF CROATIA**

IVO TRINAJSTIĆ

Dunjevac 2, 10000 Zagreb, Croatia

Trinajstić, I.: Ass. *Saxifrago tridactyliti – Hornungietum petreae* Izco 1974 (*Trachynion distachyae*) in the vegetation of Croatia. *Nat. Croat.*, Vol. 14, No. 2., 155–158, 2005, Zagreb.

This paper gives the floristic composition of a therophytic plant association, developed on the island of Hvar in Croatia, earlier discovered and studied in the region of Madrid by a Spanish botanist, Jesús Izco, under the name of *Saxifrago tridactyliti – Hornungietum petreae*. Although occupying small areas, primarily on old heaps of rejected stone of gravel size covered by leached and decalcified soil, it can nevertheless be considered important since in the vegetation cover of Croatia it contributes to the increase of biological diversity.

Key words: *Saxifrago tridactyliti – Hornungietum petreae*, island of Hvar, vegetation of Croatia

Trinajstić, I.: As. *Saxifrago tridactyliti – Hornungietum petreae* Izco 1974 (*Trachydion distachyae*) u vegetaciji Hrvatske. *Nat. Croat.*, Vol. 14, No. 2., 155–158, 2005, Zagreb.

U radu je prikazan floristički sastav posebne terofitske biljne asocijacije, razvijene na otoku Hvaru u Hrvatskoj, koju je svojevremeno u okolini Madrida otkrio i proučio španjolski botaničar Jesús Izco pod imenom *Saxifrago tridactyliti – Hornungietum petreae*. Iako zauzima malene površine, u prvom redu na stariim hrpama odbačenoga kamenja veličine šljunka, pokrivenih ispranim, dekalcificiranim tlom, možemo je smatrati značajnom jer u biljnem pokrovu Hrvatske pridonosi po-većanju biološke raznolikosti.

Ključne riječi: *Saxifrago tridactyliti – Hornungietum petreae*, otok Hvar, vegetacija Hrvatske

During plant sociology research on the island of Hvar in the spring 1975, special attention was attracted by relatively small stands of therophytic vegetation developed on heaps of finely broken stone made long ago by terrain clearing to obtain arable lands. On such heaps, a fine, leached and decalcified soil had been formed, covered by a soft turf in the floristic composition of which it was primarily the species *Saxifraga tridactylites* and *Hornungia petraea* that were dominant, with a certain number of mostly annual plants. It was evident right away that this was a special plant association, one hitherto unknown in Croatia. Subsequent analysis of the corresponding phytocoenological literature showed this to be the association *Saxifrago tridactyliti – Hornungietum petreae* which was named by IZCO (1973) and shortly af-

terwards, in the wider area of Madrid in Spain, analyzed syntaxonomically more in detail by the same author (IZCO, 1974, see also RIVAS-MARTINEZ *et al.*, 2001).

One stand on the island of Hvar, directly above the entrance into the tunnel leading to Pitve beach, whose size is about 2 m², has been analyzed floristically in more detail and its floristic composition is shown in column number 1. In column number 2 the total floristic composition of the ass. *Saxifrago tridactyliti – Hornungietum petreae* is shown, on the basis of 15 phytosociological relevés according to the data provided by IZCO (1974).

As. *Saxifrago tridactyliti – Hornungietum petreae* Izco (*Trachynion distachyae*) u vegetaciji Hrvatske

Trinajstić, I.

Tijekom fitocenoloških istraživanja na otoku Hvaru u proljeće 1975. godine posebnu su pozornost pobudile razmjerno malene sastojine terofitske vegetacije razvijene na davno nagomilanim hrpmama sitno lomljenog kamena, nastalim pri dobivanju obradivih površina. Na takvim se je hrpama formiralo fino, isprano i dekalcificirano tlo, a njega obraćajuje nježna tratinu u florističkom sastavu koje su se u prvom redu isticale vrste *Saxifraga tridactylites* i *Hornungia petrea*, uz izvjestan broj pretežito jednogodišnjih biljaka. Odmah je bilo jasno da se tu radi o nekoj posebnoj i dosad u Hrvatskoj nepoznatoj biljnoj zajednici. Naknadnom analizom odgovarajuće fitocenološke literature se je pokazalo da se radi o asocijaciji *Saxifrago tridactyliti – Hornungietum petreae*, koju je prvo IZCO (1973) samo imenovao a malo kasnije (IZCO, 1974) i pobliže analizirao iz širega područja Madrida u Španjolskoj.
