APPROXIMATION OF PERIODIC FUNCTIONS IN WEIGHTED ORLICZ SPACES

YUNUS E. YILDIRIR
Balikesir University, Turkey

Abstract. In the present work we prove some direct theorems of the approximation theory in the weighted Orlicz spaces with weights satisfying so called Muckenhoupt’s condition and we obtain some estimates for the deviation of a function in the weighted Orlicz spaces from the linear operators constructed on the basis of its Fourier series.

1. INTRODUCTION AND MAIN RESULTS

A convex and continuous function \( \Phi : [0, \infty) \to [0, \infty) \) for which \( \Phi(0) = 0 \), \( \Phi(x) > 0 \) for \( x > 0 \), and

\[
\lim_{x \to 0} \frac{\Phi(x)}{x} = 0, \quad \lim_{x \to 0} \frac{\Phi(x)}{x} = \infty
\]

is called a Young function.

The complementary Young function \( \psi \) of \( \Phi \) is defined by

\[
\psi(y) := \max \{ xy - \Phi(x) : x \geq 0 \}
\]

for \( y \geq 0 \).

A Young function \( \Phi \) said to satisfy \( \Delta_2 \) condition (\( \Phi \in \Delta_2 \)) if there is a constant \( c > 0 \) such that

\[
\Phi(2x) \leq c\Phi(x)
\]

for all \( x \in \mathbb{R} \).

A nonnegative function \( \varphi : [0, \infty) \to [0, \infty) \) is said to be quasiconvex if there exists a convex Young function \( \Phi \) and a constant \( c \geq 1 \) such that, for

2010 Mathematics Subject Classification. 41A10, 42A10.
Key words and phrases. Direct theorem, weighted Orlicz space, Muckenhoupt weight, modulus of smoothness.
all \( x \geq 0 \)
\[
\Phi(x) \leq \varphi(x) \leq \Phi(cx)
\]
holds.

Let \( T := [-\pi, \pi] \). A measurable function \( \omega : T \to [0, \infty] \) is called a weight function if the set \( \omega^{-1}(\{0, \infty\}) \) has Lebesgue measure zero.

A \( 2\pi \)-periodic weight function \( \omega \) belongs to the Muckenhoupt class \( A_p, p > 1 \), if
\[
\left( \frac{1}{|I|} \int_I \omega(x) dx \right) \left( \frac{1}{|I|} \int_I \omega^{-1/(p-1)}(x) dx \right)^{p-1} \leq C
\]
with a finite constant \( C \) independent of \( I \), where \( I \) is any subinterval of \( T \) and \( |I| \) denotes the length of \( I \).

Let \( \varphi \) be a quasiconvex Young function. We denote by \( \tilde{L}_{\varphi, \omega}(T) \) the class of Lebesgue measurable functions \( f : T \to \mathbb{C} \) satisfying the condition
\[
\int_T \varphi(|f(x)|) \omega(x) dx < \infty.
\]
The linear span of the weighted Orlicz class \( \tilde{L}_{\varphi, \omega}(T) \), denoted by \( L_{\varphi, \omega}(T) \), becomes a normed space with the Orlicz norm
\[
\|f\|_{\varphi, \omega} := \sup \left\{ \int_T |f(x)g(x)| \omega(x) dx : \int_T \psi(|g(x)|) dx \leq 1 \right\},
\]
where \( \psi \) is the complementary Young function of \( \varphi \). We define the Luxemburg norm as
\[
\|f\|_{(\varphi, \omega)} := \inf \left\{ k > 0 : \int_T \varphi(k^{-1}|f(x)|) \omega(x) dx \leq 1 \right\}.
\]
There exist ([6, p. 23]) constants \( c, C > 0 \) such that
\[
\frac{c}{p(\varphi)} := \inf \{ \beta : \beta > 0, \varphi^\beta \text{ is quasiconvex} \}
\]
([6, p. 218]).

If \( \omega \in A_{p(\varphi)} \), then it can be easily seen that \( L_{\varphi, \omega}(T) \subset L_1(T) \) and \( L_{\varphi, \omega}(T) \) becomes a Banach space with the Orlicz norm. The Banach space \( L_{\varphi, \omega}(T) \) is called weighted Orlicz space.

Throughout this paper, the constant \( c \) denotes a generic constant, i.e., a constant whose values can change even between different occurrences in a chain of inequalities.
Detailed information about Orlicz spaces, defined with respect to the convex Young function \( \varphi \), can be found in [14]. Orlicz spaces, considered in this work, are investigated in the books [6] and [20].

Let \( \varphi \in \Delta_2 \) and \( \varphi^\theta \) is quasiconvex for some \( \theta \in (0, 1) \). For \( f \in L_{\varphi,\omega}(T) \) with \( \omega \in A_p(\varphi) \), we define the shift operator \( \sigma_h \) by

\[
(\sigma_h f)(x) := \frac{1}{2h} \int_{-h}^{h} f(x + t)dt, \quad 0 < h < \pi, \quad x \in T
\]

and the \( r \)-modulus of smoothness \( (r = 1, 2, \ldots) \) by

\[
\Omega^r_{\varphi,\omega}(f, \delta) := \sup_{0 < h \leq \delta} \left\| \frac{1}{r} \prod_{i=1}^{r} (I - \sigma_{h_i}) f \right\|_{\varphi,\omega}, \quad \delta > 0,
\]

where \( I \) is the identity operator. This modulus of smoothness is well defined, because \( \sigma_h \) is a bounded linear operator on \( L_{\varphi,\omega}(T) \) under the conditions that \( \varphi \in \Delta_2 \), \( \varphi^\alpha \) is quasiconvex for some \( \alpha \), \( 0 < \alpha < 1 \), and \( \omega \in A_p(\varphi) \) ([1]).

We define the shift operator \( \sigma_h \) and the modulus of smoothness \( \Omega^r_{\varphi,\omega} \) in this way, because the space \( L_{\varphi,\omega}(T) \) is not, in general, invariant under the usual shift \( f(x) \to f(x + h) \).

We denote by \( E_n(f)_{\varphi,\omega} \) the best approximation of \( f \in L_{\varphi,\omega}(T) \) by trigonometric polynomials of degree not exceeding \( n \), i.e.,

\[
E_n(f)_{\varphi,\omega} = \inf \left\{ \| f - T_n \|_{\varphi,\omega} : T_n \in \Pi_n, \quad n = 1, 2, \ldots \right\},
\]

where \( \Pi_n \) denotes the class of trigonometric polynomials of degree at most \( n \). Note that the existence of \( T_n^* \in \Pi_n \) such that

\[
E_n(f)_{\varphi,\omega} = \| f - T_n^* \|_{\varphi,\omega}
\]

follows, for example, from [4, p. 59, Th. 1.1].

Let also

\[
f(x) \sim \sum_{k=-\infty}^{\infty} c_k e^{ikx} = \sum_{k=0}^{\infty} (a_k \cos kx + b_k \sin kx)
\]

be the Fourier series of \( f \in L^1(T) \). In addition, we put

\[
S_n(x, f) := \sum_{k=-n}^{n} c_k e^{ikx} = \sum_{k=0}^{n} (a_k \cos kx + b_k \sin kx), \quad n = 0, 1, 2, \ldots
\]

Our main results formulated in the following enable us to make conclusions concerning the rate of vanishing of the quantities \( R_n(f, \lambda)_{\varphi,\omega} \) and \( R_r(f, \lambda)_{\varphi,\omega} \) by using the modulus of smoothness \( \Omega^r_{\varphi,\omega}(f, \delta) \) and the best approximation \( E_n(f)_{\varphi,\omega} \). In the theory of approximation, statements of this sort are called direct theorems. In this paper we investigate some direct theorems of approximation theory in the weighted Orlicz spaces and get a generalization of the results appeared in [17].
In the literature many results on such approximation problems have been obtained in weighted and non-weighted Lebesgue spaces. The corresponding results in the non-weighted Lebesgue spaces can be found in the books [4] and [22]. The best approximation problems by trigonometric polynomials in weighted Lebesgue spaces with weights belonging to the Muckenhoupt class were investigated in [7] and [15]. Detailed information on weighted polynomial approximation can be found in the books [5] and [16].

Approximation by trigonometric polynomials and other related problems in the Orlicz and weighted Orlicz spaces were studied in [2,8–12,17,18,21,23,24]. Since every convex function is quasiconvex, the Orlicz spaces considered by us in this paper are more general than the Orlicz spaces studied in the above mentioned works. Therefore, the results obtained in this paper are new also in the non-weighted cases.

The relation \( \preceq \) is defined as "\( A \preceq B \iff \) there exists a constant \( C \) such that \( A \leq CB \)."

Our main results are the following.

**Theorem 1.1.** Let \( f \in L_{\varphi,\omega}(T) \), \( \varphi \in \Delta_2 \), \( \omega \in A_{p(\varphi)} \) and \( \varphi^\alpha \) be quasiconvex for some \( \alpha \in (0,1) \). For the system of numbers \( \lambda_{(n)}^\nu \left( 1 - \left( \frac{\nu}{n} \right)^2r \right) \leq n \) \( \nu \leq n \)

\[
R_n(f, \lambda)_{\varphi,\omega} := \left\| f(x) - \left[ \frac{a_0}{2} + \sum_{\nu=1}^{n} \lambda_{(n)}^\nu (a_\nu \cos \nu x + b_\nu \sin \nu x) \right] \right\|_{\varphi,\omega} \leq C \Omega_{\varphi,\omega}^k \left( f, \frac{1}{n} \right).
\]

**Theorem 1.2.** Let \( \varphi \in \Delta_2 \), \( \omega \in A_{p(\varphi)} \) and \( \varphi^\alpha \) be quasiconvex for some \( \alpha \in (0,1) \). For a sequence of functions \( \lambda_{(r)}^\nu \left( 1 - \left( \frac{\nu |r-r_0|}{n} \right)^2k \right) \leq n \) \( \nu \leq n \)

specified on some set \( E \) of the real axis and in addition for any fixed \( r \in E \) and any function \( f \in L_{\varphi,\omega} \) the series

\[
a_0^2 + \sum_{\nu=1}^{\infty} \lambda_{(r)}^\nu (a_\nu \cos \nu x + b_\nu \sin \nu x)
\]

convergences to a metric of the space \( L_{\varphi,\omega}(T) \), then

\[
R_r(f, \lambda)_{\varphi,\omega} := \left\| f(x) - \left[ \frac{a_0}{2} + \sum_{\nu=1}^{\infty} \lambda_{(r)}^\nu (a_\nu \cos \nu x + b_\nu \sin \nu x) \right] \right\|_{\varphi,\omega} \leq C \Omega_{\varphi,\omega}^k \left( f, |r-r_0| \right).
\]

**Theorem 1.3.** Let \( f \in L_{\varphi,\omega}(T) \), \( \varphi \in \Delta_2 \), \( \omega \in A_{p(\varphi)} \) and \( \varphi \left( \frac{t}{t_0} \right) \) be a Young function for some \( p_0 > 1 \) satisfying the \( \Delta_2 \) condition and \( \varphi^\alpha \) be
quasiconvex for some $\alpha \in (0, 1)$ such that
\begin{equation}
\varphi(uv) \leq c\varphi(u)\varphi(v)
\end{equation}
with a constant $c > 0$. Then for an arbitrary triangular matrix of the numbers
\[\{\lambda^{(n)}_{\nu}\} \quad (\lambda^{(n)}_{0} = 1, \lambda^{(n)}_{\nu} = 0, \nu > n, n = 0, 1, 2, \ldots)\]
\[R_n(f, \lambda)_{\varphi,\omega} \leq \left\{ \frac{m}{2}_{\nu=0}^{\infty} E_\varphi^{2^{\nu-1}}(f)_{\varphi,\omega} \delta_{2^{\nu-1}}^2 \right\}^{1/2} E_n(f)_{\varphi,\omega}\]
if $\varphi(\sqrt{u})$ is convex and
\[R_n(f, \lambda)_{\varphi,\omega} \leq \inf_{k>0} \left\{ 1 + \sum_{\nu=0}^{m} c_k E_\varphi^{2^{\nu-1}}(f)_{\varphi,\omega} \delta_{2^{\nu-1}}^2 \right\} + CE_n(f)_{\varphi,\omega}\]
if $\varphi(\sqrt{u})$ is concave, where
\[\delta_{2^{\nu},n} := \sum_{l=2^{\nu}}^{2^{\nu+1}-1} |\lambda^{(n)}_{\nu+1} - \lambda^{(n)}_{\nu}| + |1 - \lambda^{(n)}_{2^{\nu}}|,\]
\[2^m \leq n < 2^{m+1}.\]

The non-weighted analogues of these theorems were proved in [17].

2. Auxiliary Result

**Lemma 2.1.** Let $\varphi(\frac{t}{p_0})$ be a Young function for some $p_0 > 1$ satisfying the $\Delta_2$ condition. Then there exists two positive constants $c_1$ and $c_2$ such that
\[c_1 \int T \varphi(f(x)) \omega(x) \, dx \leq \int T \varphi \left( \sum_{k=0}^{\infty} \delta_k^{1/2} \right) \omega(x) \, dx \leq c_2 \int T \varphi(f(x)) \omega(x) \, dx\]
for arbitrary $f \in L^1(T) \cap L_\varphi(T)$, where
\[\delta_k := \sum_{\nu=2^k}^{2^{k+1}-1} c_\nu e^{i\nu x}, \quad \delta_0 := \frac{1}{2} a_0.\]

This lemma is proved in [13, Th. 2].

**Lemma 2.2.** Let $\varphi(\frac{t}{p_0})$ be a Young function for some $p_0 > 1$ satisfying the $\Delta_2$ condition. Let $f_n(x)$ ($n = 1, 2, \ldots$) be a sequence of $2\pi$-periodic functions in $L_\varphi,\omega(T)$, $\omega \in A_{\varphi(p)}$ and let $S_{n,k_n}(x)$ be the $k$-th partial sum of Fourier series of the function $f_n(x)$, $k = k_n$ is a function of $n$. Then there exists a positive constant $C$ such that
\[\int T \varphi \left( \sum_{n=0}^{\infty} |S_{n,k_n}(x)|^2 \right)^{1/2} \omega(x) \, dx \leq C \int T \varphi \left( \sum_{n=0}^{\infty} |f_n(x)|^2 \right)^{1/2} \omega(x) \, dx\]
with a constant $C$ is independent of $f_n(x)$.

This lemma is proved in [13, Th. 1] by taking

$$f := \sum_{n=0}^{\infty} |S_{n,k_n}(x)|^2 \quad \text{and} \quad g := \sum_{n=0}^{\infty} |f_n(x)|^2.$$ 

**Lemma 2.3.** Let $\lambda_0, \lambda_1, \ldots$ be a sequence of numbers such that

$$|\lambda_l| \leq M, \quad \sum_{\nu=2^l}^{2^{l+1}-1} |\lambda_\nu - \lambda_{\nu+1}| \leq M \quad (l = 0, 1, 2, \ldots).$$

Then the series

$$a_0\lambda_0/2 + \sum_{\nu=0}^{\infty} \lambda_\nu (a_\nu \cos \nu x + b_\nu \sin \nu x),$$

where $a_\nu$, $b_\nu$ are the Fourier coefficients of a function $f(x) \in L_{\varphi,\omega}[0, 2\pi]$, is a Fourier series of some function $h(x) \in L_{\varphi,\omega}[0, 2\pi]$ and the following inequality is valid:

$$\int_T \varphi(|h(x)|) \omega(x) dx \leq C \int_T \varphi(|f(x)|) \omega(x) dx.$$

This lemma is proved in a similar way as [23, Lemma 2.4].

### 3. Proofs of main results

**Proof of Theorem 1.** Let $2^n \leq n < 2^{n+1}$. By virtue of the property of the norm, we get

$$\left\| f(x) - \left[ \sum_{\nu=0}^{n} \lambda_\nu^{(n)} A_\nu(x) \right] \right\|_{\varphi,\omega} \leq \left\| \sum_{\nu=0}^{n} (1 - \lambda_\nu^{(n)}) A_\nu(x) \right\|_{\varphi,\omega} + \left\| \sum_{\nu=n+1}^{\infty} A_\nu(x) \right\|_{\varphi,\omega} = I_1 + I_2,$$

where $A_\nu(x) := a_\nu \cos \nu x + b_\nu \sin \nu x$. From [1, Lemma 3]

$$\| S_n(f,x) \|_{\varphi,\omega} \leq \| f(x) \|_{\varphi,\omega},$$

$$\| f(x) - S_n(f,x) \|_{\varphi,\omega} \leq E_n(f)_{\varphi,\omega}.$$

It follows from the latter inequality that

$$I_2 = \left\| \sum_{\nu=n+1}^{\infty} A_\nu(x) \right\|_{\varphi,\omega} \leq E_n(f)_{\varphi,\omega}.$$
and, since ([1, Th. 2])
\[ E_n(f_{\varphi, \omega}) \preceq \Omega_{\varphi, \omega}^{r} \left( f, \frac{1}{n} \right) \]
then
\[ \left\| \sum_{\nu=n+1}^{\infty} A_{\nu} (x) \right\| \varphi, \omega \preceq \Omega_{\varphi, \omega}^{r} \left( f, \frac{1}{n} \right) . \]

Now, we estimate
\[ I_1 = \left\| \sum_{\nu=1}^{n} \frac{1 - \lambda_{\nu} (n)}{1 - \frac{\sin \frac{\nu}{n}}{r}} A_{\nu} (x) \left( 1 - \frac{\sin \frac{\nu}{n}}{r} \right) \right\| \varphi, \omega . \]
We let
\[ \mu_{\nu, r}^{(n)} = \begin{cases} 
\frac{1 - \lambda_{\nu} (n)}{1 - \frac{\sin \frac{\nu}{n}}{r}}, & \text{for } \nu \leq n, \\
0, & \text{for } \nu > n
\end{cases} . \]
For the sequence \( \left( \mu_{\nu, r}^{(n)} \right) \) the conditions of lemma 3 are fulfilled ([3]). Then, according to lemma 3
\[ I_1 \leq \sum_{\nu=1}^{n} A_{\nu} (x) \left( 1 - \frac{\sin \frac{\nu}{n}}{r} \right) \left( 1 - \frac{\sin \frac{\nu}{n}}{r} \right) \varphi, \omega \preceq \Omega_{\varphi, \omega}^{r} \left( f, \frac{1}{n} \right) \]
and theorem 1 is proved.

**Proof of Theorem 2.** By virtue of the property of the norm we get
\[ R_{r} (f, \lambda)_{\varphi, \omega} \leq \left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu} \right) A_{\nu} (x) \right\| \varphi, \omega \]
\[ + \left\| \sum_{\nu=1}^{\infty} \frac{1 - \lambda_{\nu} (r)}{1 - \frac{\sin \nu |r - r_0|}{\nu |r - r_0|}} A_{\nu} (x) \left( 1 - \frac{\sin \nu |r - r_0|}{\nu |r - r_0|} \right) \right\| \varphi, \omega , \]
\[ = I'_1 + I'_2 . \]
We estimate
\[ I'_1 = \left\| \sum_{\nu=1}^{\infty} \frac{1 - \lambda_{\nu} \nu}{1 - \sin \frac{\nu |r - r_0|}{\nu |r - r_0|}} A_{\nu} (x) \left( 1 - \frac{\sin \nu |r - r_0|}{\nu |r - r_0|} \right) ^k \right\| \varphi, \omega , \]
\[ k = 1, 2, \ldots \]
Let us assume
\[ \mu_{\nu,r} = \begin{cases} \frac{1 - \lambda_\nu(r)}{(1 - \sin \nu |r - r_0|)^k}, & \text{for } \nu \leq \left\lfloor \frac{1}{|r - r_0|} \right\rfloor, \\ 0, & \text{for } \nu > n \end{cases} \]

For the sequence \( \{\mu_{\nu,r}^{(n)}\} \) the conditions of lemma 3 are fulfilled. Consequently, according to lemma 3, for \( 2^m \leq \left\lfloor \frac{1}{|r - r_0|} \right\rfloor < 2^{m+1} \)
\[ I_1' \leq \left\| \sum_{\nu=1}^{2^{m+1}} \mu_{\nu,r} A_\nu(x) \left( 1 - \frac{\sin \nu |r - r_0|}{\nu |r - r_0|} \right)^k \right\|_{\psi,\omega} \]
\[ \leq \left\| \sum_{\nu=1}^{\infty} A_\nu(x) \left( 1 - \frac{\sin \nu |r - r_0|}{\nu |r - r_0|} \right)^k \right\|_{\psi,\omega} \leq \Omega^k_{\psi,\omega}(f,|r - r_0|). \]

Let us now estimate \( I_2' \). It is easily seen that the conditions of lemma 3 are fulfilled for the system of numbers \( \{1 - \lambda_\nu(r)\} \). Then, according to lemma 3
\[ I_2' = \left\| \sum_{\nu=\left\lfloor \frac{1}{|r - r_0|} \right\rfloor + 1}^{\infty} (1 - \lambda_\nu(r)) A_\nu(x) \right\|_{\psi,\omega} \leq \left\| \sum_{\nu=\left\lfloor \frac{1}{|r - r_0|} \right\rfloor + 1}^{\infty} A_\nu(x) \right\|_{\psi,\omega}. \]

Hence, as in Theorem 1, it follows
\[ I_2' \leq \Omega^k_{\psi,\omega}(f,|r - r_0|). \]

The latter completes the proof of the theorem.

**Proof of Theorem 3.** Let \( 2^m \leq n < 2^{m+1} \). We obtain by means of our previous argument the following
\[ R_n(f,\lambda)_{\psi,\omega} = \left\| f(x) - \sum_{\nu=0}^{n} \lambda_\nu^{(n)} A_\nu(x) \right\|_{\psi,\omega} \]
\[ \leq \left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_\nu^{(n)} \right) A_\nu(x) \right\|_{\psi,\omega} + \left\| \sum_{\nu=n+1}^{\infty} A_\nu(x) \right\|_{\psi,\omega} \]
\[ \leq \left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_\nu^{(n)} \right) A_\nu(x) \right\|_{\psi,\omega} + E_n(f)_{\psi,\omega}. \]
Let \( \varphi (\sqrt{u}) \) be a convex function. Bearing in mind the equivalence of the norms (1.1) and (1.2), by virtue of lemma 1, we have

\[
\left\| \sum_{l=1}^{n} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x) \right\|_{(\varphi, \omega)}
\]

\[
= \inf \left( k > 0 : \int_{T} \varphi \left( k^{-1} \sum_{l=1}^{n} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x) \right) \omega (x) dx \leq 1 \right)
\]

\[
\leq \inf \left( k > 0 : c_{\varphi} \int_{T} \varphi \left( k^{-1} \sum_{l=0}^{m} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x) \right)^{2} \frac{1}{k} \right) \omega (x) dx \leq 1 \right).
\]

Moreover, due to (1.3), the constant \( D_{\varphi} \) may be chosen such that

\[
(3.2) \quad c_{\varphi} \varphi (u) \leq \varphi (D_{\varphi} u).
\]

Then

\[
\left\| \sum_{l=1}^{n} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x) \right\|_{(\varphi, \omega)}
\]

\[
\leq \inf \left( k > 0 : \int_{T} \varphi \left( D_{\varphi} k^{-1} \left( \sum_{l=0}^{m} \sigma_{n, \mu}^{2} (x) \right)^{1/2} \right) \omega (x) dx \leq 1 \right),
\]

where

\[
\sigma_{n, \mu} (x) = \sum_{l=0}^{2^{\nu} n - 1} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x).
\]

Let \( \psi (u) = \varphi (\sqrt{u}) \). Then

\[
\left\| \sum_{l=1}^{n} \left( 1 - \lambda_{l}^{(n)} \right) A_{\nu} (x) \right\|_{(\psi, \omega)}
\]

\[
\leq \inf \left( k > 0 : \int_{T} \psi \left( D_{\psi} k^{-2} \sum_{l=0}^{m} \sigma_{n, \mu}^{2} (x) \right) \omega (x) dx \leq 1 \right)
\]

\[
= \left[ \inf \left( k > 0 : \int_{T} \psi \left( D_{\psi} k^{-1} \sum_{l=0}^{m} \sigma_{n, \mu}^{2} (x) \right) \omega (x) dx \leq 1 \right) \right]^{1/2}
\]

\[
= D_{\psi} \left\| \sum_{l=0}^{m} \sigma_{n, \mu}^{2} (x) \right\|_{(\psi, \omega)}^{1/2} \leq D_{\psi} \left[ \sum_{l=0}^{m} \left\| \sigma_{n, \mu} (x) \right\|_{(\psi, \omega)}^{2} \right]^{1/2}
\]

\[
= D_{\psi} \left[ \sum_{l=0}^{m} \left\| \sigma_{n, \mu} (x) \right\|_{(\psi, \omega)}^{2} \right]^{1/2},
\]
where
\[
\|\sigma_{n,\mu}^2(x)\|_{(\psi, \omega)} = \inf \left( k > 0 : \int_{T} \psi \left( k^{-1} \sigma_{n,\mu}^2(x) \right) \omega(x) dx \leq 1 \right)
\]
\[
= \inf \left( k > 0 : \int_{T} \varphi \left( k^{-1/2} \sigma_{n,\mu}(x) \right) \omega(x) dx \leq 1 \right)
\]
\[
= \inf \left( t^2 > 0 : \int_{T} \varphi \left( t^{-1} \sigma_{n,\mu}(x) \right) \omega(x) dx \leq 1 \right)
\]
\[
= \|\sigma_{n,\mu}(x)\|^2_{(\varphi, \omega)}.
\]

If we apply the Abel transform to \(\Delta_{r,\sigma}\)
\[
\sigma_{n,\mu}(x) = \sum_{\nu=2^\mu}^{2^{\mu+1} - 1} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x)
\]
\[
= \sum_{\nu=2^\mu}^{2^{\mu+1} - 1} (S_{\nu}(f, x) - S_{2^{\nu+1} - 1}(f, x)) \left( \lambda_{\nu+1}^{(n)} - \lambda_{\nu}^{(n)} \right)
\]
\[
+ (S_{2^{\nu+1} - 1}(f, x) - S_{2^{\nu} - 1}(f, x)) \left( 1 - \lambda_{2^\nu}^{(n)} \right).
\]

Then, by virtue of the inequality (3.1) and the monotonicity of the sequence of best approximations, we have
\[
\|\sigma_{n,\mu}(x)\|_{(\varphi, \omega)} \leq \sum_{\nu=2^\mu}^{2^{\mu+1} - 1} \|S_{\nu}(f, x) - S_{2^{\nu+1} - 1}(f, x)\|_{(\varphi, \omega)} \left| \lambda_{\nu+1}^{(n)} - \lambda_{\nu}^{(n)} \right| +
\]
\[
+ \|S_{2^{\nu+1} - 1}(f, x) - S_{2^{\nu} - 1}(f, x)\|_{(\varphi, \omega)} \left| 1 - \lambda_{2^\nu}^{(n)} \right|
\]
\[
\leq E_{2^{\nu} - 1}(f)_{\varphi, \omega} \delta_{2^{\nu}, n}.
\]

Then
\[
\left\| \sum_{\nu=1}^{\nu} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right\|_{(\varphi, \omega)} \leq D_{\varphi} \left( \sum_{\nu=0}^{m} E_{2^{\nu} - 1}(f)_{\varphi, \omega} \delta_{2^{\nu}, n}^2 \right)^{1/2}.
\]
Let \( \varphi(\sqrt{u}) \) be a concave function. In the inequality (3.1), we use the well-known formula for calculation of the (norm [14, p. 92]):

\[
\left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right\|_{\varphi, \omega} = \inf_{k > 0} k^{-1} \left( 1 + \int_{T} \varphi \left( k \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right) \omega(x)dx \right).
\]

Applying lemma 1 and (3.2), we obtain

\[
\left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right\|_{\varphi, \omega} = \inf_{k > 0} k^{-1} \left( 1 + \int_{T} \varphi \left( D_{\varphi}k^{2} \sum_{\mu=0}^{m} \sigma_{n,\mu}^{2}(x) \right)^{1/2} \omega(x)dx \right).
\]

Since \( \varphi(\sqrt{u}) \) is concave, we have

\[
\left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right\|_{\varphi, \omega} = \inf_{k > 0} k^{-1} \left( 1 + \sum_{\mu=0}^{m} \int_{T} \varphi \left( D_{\varphi}k\sigma_{n,\mu}(x) \right) \omega(x)dx \right).
\]

Using the proof of lemma 9.2 in [14, p. 74], it is easily seen that

\[
\int_{T} \varphi \left( \frac{u(x)}{\|u(x)\|_{\varphi, \omega}} \right) \omega(x)dx \leq 1.
\]

Using this inequality, (1.3) and (3.2)

\[
\int_{T} \varphi \left( D_{\varphi}k\sigma_{n,\mu}(x) \right) \omega(x)dx
\]

\[
= c'(\varphi) \int_{T} \varphi \left( \frac{\sigma_{n,\mu}(x)}{\|\sigma_{n,\mu}(x)\|_{\varphi, \omega}} \right) \varphi \left( D_{\varphi}k \|\sigma_{n,\mu}(x)\|_{\varphi, \omega} \right) \omega(x)dx
\]

\[
\leq \varphi \left( D_{\varphi}'k \|\sigma_{n,\mu}(x)\|_{\varphi, \omega} \right).
\]

Consequently, we obtain

\[
\left\| \sum_{\nu=1}^{n} \left( 1 - \lambda_{\nu}^{(n)} \right) A_{\nu}(x) \right\|_{\varphi, \omega} \leq \inf_{k > 0} k^{-1} \left( 1 + \sum_{\mu=0}^{m} \varphi \left( D_{\varphi}'k \|\sigma_{n,\mu}(x)\|_{\varphi, \omega} \right) \right)
\]

\[
\leq \inf_{k > 0} k^{-1} \left( 1 + \sum_{\mu=0}^{m} \varphi \left( D_{\varphi}'k E_{2\nu-1}(f)_{\varphi, \omega} \delta_{2\nu} \right) \right).
\]

This completes the proof.
