Received May 13, 1991

Two bulky hydroxy-isopropyl substituents on the quadricyclane **2** generate a compression of the intramolecular hydrogen bond (014...015 2.687 Å) and a lengthening of the C1-C5 bond (1.573 Å) of the four membered ring. The corresponding values of the bis(hydroxymethyl) derivative **1** are 010...011 2.799 Å and C1-C5 1.546 Å, respectively.

INTRODUCTION

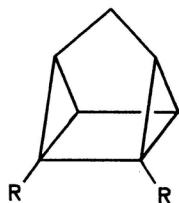

Within a project of determining the bonding system of polycyclic small-membered rings and the influences of substituents on the molecular dimensions of these compounds¹, we established the structure of two quadricyclane derivatives 1,5-bis(hydroxymethyl)quadricyclane (tetracyclo[3.2.0.0^{2,7}.0^{4,6}]heptane-1,5-dimethanol) **1** and 1,5-bis(hydroxy-iso-propyl)quadricyclane ($\alpha,\alpha,\alpha',\alpha'$ -tetramethyl-tetracyclo[3.2.0.0^{2,7}.0^{4,6}]heptane-1,5-dimethanol) **2**. Simultaneous intra- and intermolecular hydrogen bonds are predetermined for these double functional compounds. L. Pauling has worked at hydrogen bond systems extensively.²

RESULTS AND DISCUSSION

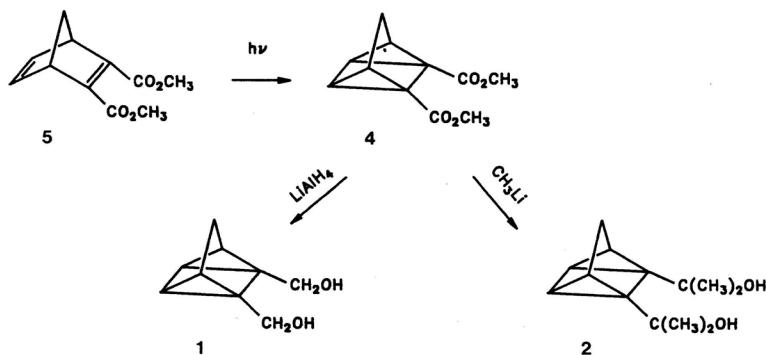

In order to determine the influence of the electron accepting cyano groups on the strained bonds of the quadricyclane system, we investigated the structure of the di-cyano derivative **3**.³ For the purpose of comparison we required derivatives with substituents not exerting electronic effects onto the polycyclic systems. Therefore, we synthesized the 1,5-bis(hydroxymethyl)quadricyclane **1** by reduction with LiAlH₄ from the corresponding dimethyl dicarboxylate **4**.⁴ The 1,5-bis(hydroxy-isopropyl)quadricyclane **2** was obtained by treatment of **4** with methylolithium.⁵ The quadricyclane-dicarboxy-

4: R=CO₂CH₃

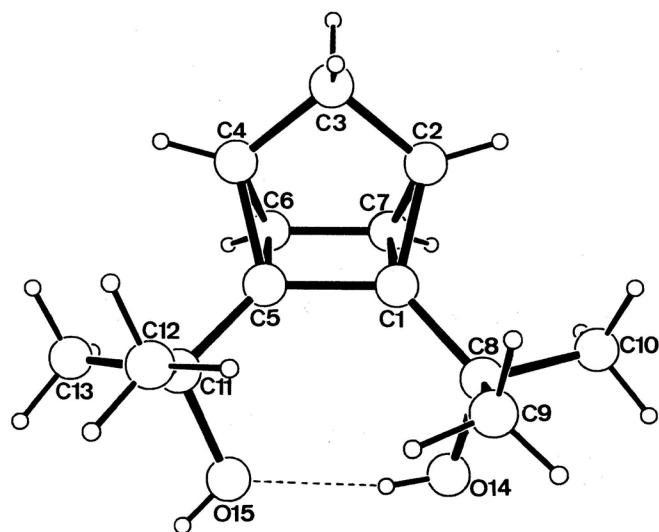

late **4**⁶ is available from the dimethyl bicyclo[2.2.1]hept-2,5-diene-2,3-dicarboxylate **5** by photochemical, intramolecular [2+2] cycloaddition.⁷

Electron accepting substituents exert significant electronic effects on the bond lengths of quadricyclane.^{3,8} The derivatives **1** and **2** are not influenced by these effects. Therefore, all the bond lengths of the three membered rings have the same order of magnitude (on the average: 1.517(3) Å for **1** and 1.510(8) Å for **2**; Table I) and compare well within the margin of significance with the corresponding values of the 3-oxybenzonitrile-quadricyclane **6**, substituted only on the bridging carbon C3 (1.491 Å)⁸ and of quadricyclane (clathrate 1.53 Å⁹; ED 1.51 Å¹⁰, *ab initio* calculation 6-31G 1.519 Å¹¹). However, the C1-C5 bonds on the substituted side of the four membered rings of **1** and **2** are lengthened by repulsive forces between the substituents. The C1-C5 bond (1.573 Å) in **2** compared with C6-C7 (1.518 Å) on the unsubstituted side is considerably more extended than the corresponding bond in **1** (C1-C5 1.546 Å; C6-C7 1.531 Å). The bulky isopropyl groups generate a stronger steric strain in **2** relative to **1**. Both oxygen atoms O14...O15 in the intramolecular hydrogen bond of **2** are compressed to a distance of 2.687 Å, which is shorter than the corresponding distance O15...O14' 2.764 Å of the intermolecular hydrogen bond (Table II). The distances of the corresponding hydrogen bonds in **1** have the opposite sequence: intramolecular O10...O11 2.799(2) Å; intermolecular O11...O10'(2-x,-0.5+y, 1-z) 2.706(2) Å (Table II). The corresponding bond lengths of the unsubstituted fourmembered rings of **6** (1.544 Å)⁸ and of quadricyclane (clathrate 1.53 Å⁹; ED 1.565 Å¹⁰, *ab initio* calculation 6-31G 1.549 Å¹¹) are shorter than the highly strained C1-C5 bond of **2**.

EXPERIMENTAL

Tetracyclo[3.2.0.0^{2,7}.0^{4,6}]heptane-1,5-dimethanol **1**, 1,5-bis(hydroxymethyl)quadricyclane **1** was obtained in an oily mixture with other compounds.⁴ We synthesized and isolated pure crystals according to the following procedure.

A solution of 1 gr (0.0048 mol) quadricyclane-dicarboxylate **4**¹² in 10 ml absolute ether was slowly added to 0.364 g (0.0096 mol) lithium aluminiumhydride elutriated in 15 ml absolute ether and refluxed for 1 hour. The excess of LiAlH₄ was destroyed by adding a saturated Na₂SO₄ solution. The salt residue was sucked off and washed with ether. The ether was removed and the residual yellow oil was recrystallized several times at -30 °C from acetone. Yield 0.52 g (0.0034 mol; 71% colourless prisms, m.p. 73 °C).

¹H-NMR (300 MHz, CDCl₃, 294 K): δ = 3.94, 3.61 (AM, d 2H, d 2H, J_{AM} = 12.5 Hz, -CH₂-O), 3.86 (br s, 2H, -OH), 2.01, 1.92 (AM, d 1H, d 1H, J_{AM} = 11.1 Hz, -CH₂-), 1.80, 1.46 (AX, d 2H, d 2H, J_{AX} = 4.4 Hz, -CH). IR (KBr): 3270 br (-OH), 2920 s, 2850 s (C-H), 1450 s, 1005 s, 875 m [cm⁻¹].

*α,α,α',α'-tetramethyl-tetracyclo[3.2.0.0^{2,7}.0^{4,6}]heptane-1,5-dimethanol **2**.*

To a solvent of 2 g (0.0096 mol) of **4** 0.04 mol methylolithium freshly prepared was added. After 2 hours, the lithium salt was hydrolyzed by 20 ml H₂O. The aqueous mixture was extracted with ether and the ether was removed. Yield 1.64 g (0.0078 mol; 82%) of crude **2**. Several times recrystallized from acetone: 1.44 g (0.0069 mol; 72%) colourless crystals m.p. 152 °C (lit.⁵ m.p. 153–155 °C).

Crystallographic Data.

The X-ray structure investigations have been carried out with an Enraf-Nonius CAD 4 diffractometer with Mo-K α radiation, graphite monochromator, ω -2θscanning. The structures have been solved by direct methods (SDP program system¹³). The X-ray data of **1** were collected at –40 °C because of its instability. The crystallographic data and the refinement parameters are listed in Table III, the atomic coordinates of **1** and **2** and the averaged anisotropic thermal parameters (U_{eq}) are given in Table IV.¹⁴

SAŽETAK

Intramolekularna vodikova veza kod novih derivata kvadriciklena

H. Irngartinger i R. Jahn

Geometrijska struktura kvadriciklena supstituiranog velikim hidroksi-izopropilnim skupinama na položajima C₁ i C₅ određena je metodom difrakcije X-zraka. Strukturni parametri uspoređeni su s podacima za bis-hidroksimetil-derivat kvadriciklena. Utvrđeno je da se udaljenost između atoma kisika smanjuje, dok se duljina veze C₁-C₅ povećava.
