Solving the utility maximization problem with CES and Cobb-Douglas utility function via mathematical inequalities
Solving the utility maximization problem with CES and Cobb-Douglas utility function via mathematical inequalities

Abstract

This paper presents a new, non-calculus approach to solving the utility maximization problem with CES utility function, as well as with Cobb-Douglas utility function in case of \( n \geq 2 \) commodities. Instead of using the Lagrange multiplier method or some other method based on differential calculus, these two maximization problems are solved by using Jensen's inequality and weighted arithmetic-geometric mean (weighted AM-GM) inequality. In comparison with calculus methods, this approach does not require checking the first and the second order conditions.

Key words:
Utility maximization problem, CES and Cobb-Douglas utility function, mathematical inequalities, without calculus

1. INTRODUCTION

In the last thirty years mathematical inequalities have been applied to various economic problems. In particular, mathematical inequalities such as arithmetic-geometric mean inequality and Cauchy-Buniakowsky-Schwarz inequality, have been used to solve many optimization problems in the field of inventory theory (see [2], [3], [8]). A good review of papers that deal with applications of mathematical inequalities to inventory theory models can be found in [3]. The most significant contribution of these papers is reflected in the fact that some important optimization problems in economics which cannot be trivially solved by using methods based on calculus are solved in a way much easier to understand, thus providing better insight into the nature of the problem. In this paper we consider two standard and very important microeconomic problems: the utility maximization problem with CES utility function and the utility maximization problem with Cobb-Douglas utility function. These two problems are usually solved by using differential calculus. However, standard microeconomic textbooks show solution only in the case of \( n=2 \) commodities (see for instance [5] and [7]). Therefore, the aim of this paper is to show how to solve these problems in an easier manner via mathematical inequalities for arbitrary \( n \geq 2 \). In this paper we use the following mathematical inequalities.

**Theorem 1.** (Jensen’s inequality) Let \( n \) be a positive integer. If \( f \) is a convex function on \([a, b]\), then for any choice of \( t_1, \ldots, t_n \in [0, 1] \) such that \( \sum_{i=1}^{n} t_i = 1 \), and for all \( x_1, \ldots, x_n \in [a, b] \) the inequality

\[
 f(t_1 x_1 + \cdots + t_n x_n) \leq t_1 f(x_1) + \cdots + t_n f(x_n)
\]

holds. The equality in (1) holds if and only if \( x_1=\cdots=x_n \). Note: if \( f \) is concave function, then in (1) reverse inequality holds.

**Theorem 2.** (Weighted AM-GM inequality) Let \( n \) be a positive integer. If \( x_1, \ldots, x_n \) and \( t_1, \ldots, t_n \) are positive numbers such that \( \sum_{i=1}^{n} t_i = 1 \), then

\[
 x_1^{t_1} \cdots x_n^{t_n} \leq t_1 x_1 + \cdots + t_n x_n.
\]

The equality in (2) holds if and only if \( x_1=\cdots=x_n \).

Proofs of the previous theorems can be found, for instance, in [1] or [4].

2. CASE \( n=2 \)

The consumer utility maximization problem can be stated as

\[
 \max_{x_1, \ldots, x_n \geq 0} u(x_1, \ldots, x_n)
\]

s. t. \( \sum_{i=1}^{n} p_i x_i = y \) \hspace{1cm} (4)

where \( n \) is a positive integer and represents the number of commodities that consumer buys, \( x_i \geq 0 \) is the quantity of commodity \( i \), \( p_i > 0 \) is the price per unit of commodity \( i \), \( y > 0 \) is a consumer’s fixed money income and \( u \) is a strictly increasing and strictly quasiconcave utility function. If \( u \) is the CES utility function, then in case of \( n=2 \) commodities the problem (3)-(4) becomes the utility maximization problem with CES utility function (5)-(6):

\[
 \max_{x_1, x_2 \geq 0} u_{\text{CES}}(x_1, x_2) = A\left(\alpha_1 x_1^\rho + \alpha_2 x_2^\rho\right)^{\frac{1}{\rho}}
\]

s. t. \( p_1 x_1 + p_2 x_2 = y \) \hspace{1cm} (6)
where \( \rho \in (-\infty, 1) \setminus \{0\} \), coefficients \( 0 < \alpha_1, \alpha_2 < 1 \) describe consumer preferences and \( A > 0 \) is the scale of production. Similarly, if \( u \) is the Cobb-Douglas utility function, then in case of \( n=2 \) problem (3)-(4) becomes the utility maximization problem with Cobb-Douglas utility function (7)-(8):

\[
\max_{x_1, x_2 \geq 0} u^{C-D}(x_1, x_2) = A^{\rho} x_1^\rho x_2^\rho
\]

s. t. \( p_1 x_1 + p_2 x_2 = y \).

**Theorem 3.** The maximum utility in problem (5)-(6) is equal to

\[
u^{CES}_{\max} = Ay \left( \alpha_1^{\frac{1}{1+\rho}} p_1^{\frac{1}{1+\rho}} + \alpha_2^{\frac{1}{1+\rho}} p_2^{\frac{1}{1+\rho}} \right)^{\frac{1}{1+\rho}}
\]

and it is achieved for the unique global maximizer \( \left( x_1^{*CES}, x_2^{*CES} \right) \) where

\[
x_k^{*CES} = \frac{y}{\sum_{i=1}^{2} p_i \left( \frac{\alpha_k}{p_k} \right)^{\frac{1}{1+\rho}}}, \quad k = 1, 2.
\]

Proof. We proceed as in [6]. From (6) we get

\[
x_2 = \frac{y}{p_2} - \frac{p_1}{p_2} x_1.
\]

Substituting (11) in (5), we transform the problem (5)-(6) into an unconstrained maximization problem

\[
\max_{x_1 \geq 0} -u^{CES}(x_1) = \alpha_1 x_1^{\rho} + \alpha_2 \left( \frac{y}{p_2} - \frac{p_1 x_1}{p_2} \right)^{\frac{1}{1+\rho}}
\]

where \( u^{CES} \) is a function of one variable. Let \( \varepsilon > 0, t_1 = \frac{1}{1+\varepsilon}, t_2 = \frac{\varepsilon}{1+\varepsilon} \). Note that \( 0 < t_1, t_2 < 1, t_1 + t_2 = 1 \).

Note that function \( u^{CES} \) from (12) can equivalently be written as

\[
u^{CES}(x_1) = A \left( (1+\varepsilon) t_1 \alpha_1 x_1^{\rho} + (1+\varepsilon) t_2 \frac{\alpha_2}{\varepsilon} \left( \frac{y}{p_2} - \frac{p_1 x_1}{p_2} \right)^{\frac{1}{1+\rho}} \right)^{\frac{1}{1+\rho}}
\]

Let us consider functions \( f, g : (0, +\infty) \rightarrow IR, f(x) = x^{\rho}, g(x) = x^{\frac{1}{1+\rho}} \). It is trivial to show that if \( \rho \in (-\infty, 0) \), then \( f \) is convex and \( g \) is decreasing. If \( \rho \in (0, 1] \), then \( f \) is concave and \( g \) is increasing. If we combine these facts with Theorem 1, then from (13) it follows

\[
u^{CES}(x_1) \leq (1+\varepsilon)^{\frac{1}{1+\rho}} A \left( t_1 \alpha_1 x_1^{\rho} + t_2 \left( \frac{\alpha_2}{\varepsilon} \right)^{\frac{1}{1+\rho}} \left( \frac{y}{p_2} - \frac{p_1 x_1}{p_2} \right)^{\frac{1}{1+\rho}} \right).
\]

The equality in (14) holds if and only if \( t_1 \alpha_1 x_1^{\rho} - t_2 \left( \frac{\alpha_2}{\varepsilon} \right)^{\frac{1}{1+\rho}} \frac{p_1}{p_2} x_1 = 0 \) for all \( x_1 \). This is possible if and only if

\[
t_1 \alpha_1^{\rho} = t_2 \left( \frac{\alpha_2}{\varepsilon} \right)^{\frac{1}{1+\rho}} \frac{p_1}{p_2} \iff t_1 = \left( \frac{\alpha_2}{\varepsilon \alpha_1} \right)^{\frac{1}{1+\rho}} \frac{p_1}{p_2}.
\]
Since \( t_1 + t_2 = 1 \) and \( \frac{t_1}{t_2} = \frac{1}{\varepsilon} \), from (15) we obtain
\[
\varepsilon = \left( \frac{\alpha_1}{\alpha_2} \right)^{1-\rho} \left( \frac{p_1^\rho}{p_2} \right)^{\frac{1}{1-\rho}},
\]
(16)
\[
t_1 = \frac{1}{1 + \left( \frac{\alpha_2}{\alpha_1} \right)^{1-\rho} \left( \frac{p_1^\rho}{p_2} \right)^{\frac{1}{1-\rho}}}, \quad t_2 = \frac{p_1^\rho}{1 + \left( \frac{\alpha_2}{\alpha_1} \right)^{1-\rho} \left( \frac{p_1^\rho}{p_2} \right)^{\frac{1}{1-\rho}}}.
\]
(17)
If we substitute (16) and (17) into (14), we obtain the maximum level of utility in case of CES utility function \( u_{\text{max}}^{\text{CES}} \), that is
\[
u_{\text{max}}^{\text{CES}} = Ay \left( \alpha_1^{1-\rho} p_1^\rho + \alpha_2^{1-\rho} p_2^\rho \right)^{\frac{1-\rho}{\rho}}.
\]
(18)
We still need to obtain the unique level of commodity quantities \( x_1 \) and \( x_2 \) for which the global maximum is obtained. By applying Theorem 1 to (11), we obtain that the maximum utility level (18) is achieved if and only if
\[
\frac{1}{\alpha_1^\rho} x_1 = \left( \frac{\alpha_2}{\varepsilon} \right)^{\rho} \left( \frac{y}{p_2} - \frac{p_1}{p_2} x_1 \right).
\]
(19)
Now, from (11), (16), (17) and (19), the unique global maximizer \( (x_1^{*\text{CES}}, x_2^{*\text{CES}}) \) for the problem (5)-(6) can be easily obtained as
\[
x_k^{*\text{CES}} = \frac{y}{\sum_{i=1}^2 p_i \left( \frac{p_i}{p_k} \frac{\alpha_k}{\alpha_i} \right)^{\frac{1-\rho}{\rho}}}, \quad k = 1, 2.
\]
(20)
The results (18) and (20) have the same form as in [5]. Q.E.D.

**Theorem 4.** The maximum utility in problem (7)-(8) is equal to
\[
u_{\text{max}}^{\text{C-D}} = \frac{Ax_1^{\alpha_1} x_2^{\alpha_2}}{(\alpha_1 + \alpha_2)^{\alpha_1 + \alpha_2} p_1^{\alpha_1} p_2^{\alpha_2}},
\]
(21)
and it is achieved for the unique global maximizer \( (x_1^{*\text{C-D}}, x_2^{*\text{C-D}}) \) where
\[
x_k^{*\text{C-D}} = \frac{\alpha_k y}{p_k (\alpha_1 + \alpha_2)}, \quad k = 1, 2.
\]
(22)
Proof. By substituting (11) in (7), we obtain the unconstrained maximization problem
\[
\max_{x_i \geq 0} u_{i=0}^{\text{C-D}} (x_i) = Ax_1^{\alpha_1} \left( \frac{y - p_1 x_1}{p_2} x_1^{\alpha_1} \right).
\]
(23)
Let us transform (23) in the following way:
Since \( \frac{\alpha_1}{\alpha_1 + \alpha_2} + \frac{\alpha_2}{\alpha_1 + \alpha_2} = 1 \), by applying Theorem 2 to (24), we obtain
\[
-\frac{C-D}{u}(x_i) \leq A \frac{\alpha_1 \alpha_2}{p_1 \beta_1^2} \left( \frac{\alpha_1}{\alpha_1 + \alpha_2} p_1 x_i + \frac{\alpha_2}{\alpha_1 + \alpha_2} y - \frac{\alpha_2}{\alpha_1 + \alpha_2} \alpha_1 p_1 x_i \right)
\]
\[
= A \frac{\alpha_1 \alpha_2}{p_1 \beta_1^2} \left( \frac{\alpha_1}{\alpha_1 + \alpha_2} \alpha_1 p_1 x_i + \frac{\alpha_2}{\alpha_1 + \alpha_2} (\alpha_1 y - \alpha_1 p_1 x_i) \right) \frac{\alpha_1 + \alpha_2}{\alpha_1 + \alpha_2} \alpha_1 p_1 x_i
\]
(25)

Thus, by Theorem 2, the maximum utility level is equal to
\[
u_{C-D}^{\max} = \frac{A \alpha_1 \alpha_2}{p_1 \beta_1^2} \frac{\alpha_1 + \alpha_2}{\alpha_1 + \alpha_2} \alpha_1 p_1 x_i
\]
(26)

and it is achieved if and only if
\[\alpha_2 p_1 x_i = \alpha_1 y - \alpha_1 p_1 x_i.\]
(27)

From (27) we get the unique optimal quantities of commodities 1 and 2, i.e. the unique global maximizer \((x_1^{C-D}, x_2^{C-D})\), where
\[
x_1^{C-D} = \frac{\alpha_1}{p_1 (\alpha_1 + \alpha_2)} y, \quad x_2^{C-D} = \frac{\alpha_2}{p_2 (\alpha_1 + \alpha_2)} y.
\]
(28)

Q.E.D.

One of the common assumption in economics is that utility function needs to be quasiconcave. In order for the Cobb-Douglas function to meet this condition, coefficients \(\alpha_1, \alpha_2 \geq 0\) have to satisfy the condition \(\alpha_1 + \alpha_2 \leq 1\). If \(\alpha_1 + \alpha_2 = 1\), that is if the Cobb-Douglas function exhibit constant returns to scale, then (26) and (28) can be simplified as
\[
u_{C-D}^{\max} = A \frac{\alpha_1 \alpha_2}{p_1 \beta_1^2} \frac{\alpha_1 + \alpha_2}{\alpha_1 + \alpha_2} \alpha_1 p_1 x_i
\]
(29)

Results (9), (10) and (29) are already known in contemporary microeconomic literature. However, to the best of my knowledge, this is the first time that these results are derived by using mathematical inequalities.

In the next section, the results are generalized for the case of \(n > 2\) commodities. To the best of my knowledge, the results obtained for the general case are unknown in contemporary economic and mathematical literature.

3. GENERAL CASE \(n > 2\)

We consider the following utility maximization problem in case of CES utility function for \(n > 2\):
\[
\max_{x_1, \ldots, x_n} u^{CES}(x_1, \ldots, x_n) = A \left( \alpha_1 x_1^\rho + \cdots + \alpha_n x_n^\rho \right) \frac{1}{\rho}
\]
\[
\text{s. t. } p_1 x_1 + \cdots + p_n x_n = y.
\]
(30)
(31)

Theorem 5. The maximum level of utility in problem (30)-(31) is equal to
\[
    u_{\text{max}}^{\text{CES}} = A y \left( \sum_{i=1}^{n} \alpha_{i}^{\rho} p_{i}^{\rho-1} \right)^{\frac{1-\rho}{\rho}} 
\]

and it is achieved for the unique global maximizer \( \left( x_{1}^{*,\text{CES}}, \ldots, x_{n}^{*,\text{CES}} \right) \), where

\[
x_{k}^{*,\text{CES}} = \frac{y}{\sum_{i=k}^{n} p_{i} \left( \frac{\alpha_{i}}{\alpha_{k}} \right)^{\rho-1}}, \quad k = 1, 2, \ldots, n.
\]

**Proof.** We prove the theorem by using mathematical induction over the number of commodities \( n \geq 2 \).

(i) The claim of Theorem 5 holds for \( n = 2 \), as shown in Theorem 3.

(ii) Assume that the claim of Theorem 5 holds for \( k = 2, 3, \ldots, n \).

(iii) Let us prove that the claim of Theorem 5 holds for \( k = n + 1 \).

Consider the following utility maximization problem

\[
    \max_{x_{n+1} \geq 0} \quad u^{\text{CES}}(x_{1}, \ldots, x_{n+1}) = A \left( \alpha_{1} x_{1}^{\rho} + \cdots + \alpha_{n+1} x_{n+1}^{\rho} \right)^{\frac{1}{1-\rho}}
\]

s.t. \( p_{1} x_{1} + \cdots + p_{n+1} x_{n+1} = y \).

From (35) we obtain

\[
x_{n+1} = \frac{y}{p_{n+1}} - \frac{p_{1}}{p_{n+1}} x_{1} - \cdots - \frac{p_{n}}{p_{n+1}} x_{n}.
\]

Substituting (36) into (35) we obtain

\[
u^{\text{CES}}(x_{1}, \ldots, x_{n+1}) = A \left( \alpha_{1} x_{1}^{\rho} + \cdots + \alpha_{n+1} x_{n+1}^{\rho} \right)^{\frac{1}{1-\rho}},
\]

where \( \bar{x}_{n} = y - p_{1} x_{1} - \cdots - p_{n+1} x_{n+1} \). By the same reasoning as when obtaining (12) and (18), we apply the claim (i) to terms \( \alpha_{n} x_{n}^{\rho} \) and \( \alpha_{n+1} \left( \frac{\bar{x}_{n} - p_{n} x_{n}}{p_{n+1} x_{n}} \right)^{\rho} \) from (37) and thus obtain

\[
u^{\text{CES}}(x_{1}, \ldots, x_{n+1}) \leq A \left( \alpha_{1} x_{1}^{\rho} + \cdots + \alpha_{n+1} x_{n+1}^{\rho} \right)^{\frac{1}{1-\rho}} + \frac{1}{\alpha_{n+1}^{\rho} p_{n+1}^{\rho-1}} \frac{1}{\alpha_{n}^{\rho} p_{n}^{\rho-1}} = A \left( \alpha_{1} x_{1}^{\rho} + \cdots + \alpha_{n+1} x_{n+1}^{\rho} + \bar{x}_{n} x_{n}^{\rho} \right)^{\frac{1}{1-\rho}},
\]

where \( \bar{x}_{n} = \left( \frac{1}{\alpha_{n+1}^{\rho} p_{n+1}^{\rho-1}} + \frac{1}{\alpha_{n}^{\rho} p_{n}^{\rho-1}} \right)^{\frac{1}{1-\rho}} \). Note that maximizing the expression on the left hand side of (38) is equivalent to the following problem:

\[
    \max_{x_{1}, \ldots, x_{n+1}, \bar{x}_{n} \geq 0} \quad u^{\text{CES}}(x_{1}, \ldots, x_{n+1}, \bar{x}_{n}) = A \left( \alpha_{1} x_{1}^{\rho} + \cdots + \alpha_{n} x_{n}^{\rho} + \bar{x}_{n} x_{n}^{\rho} \right)^{\frac{1}{1-\rho}}
\]

s.t. \( p_{1} x_{1} + \cdots + p_{n} x_{n} + \bar{x}_{n} x_{n+1} = y \).

By applying claim (ii) to (39)-(40), from (38) we get

\[
u^{\text{CES}}(x_{1}, \ldots, x_{n+1}) \leq A y \left( \sum_{i=1}^{n} \alpha_{i}^{\rho} p_{i}^{\rho-1} + \alpha_{n+1} x_{n+1}^{\rho} \right)^{\frac{1}{1-\rho}}
\]

Now, the equality in (38) is achieved if and only if
\[ x_n = \frac{x_n}{1} + \frac{x_{n+1}}{1}, \quad x_{n+1} = \frac{x_n}{1} + \frac{x_{n+1}}{1}. \]  
(42)

Furthermore, equality in (41) is achieved if and only if
\[ x_i = \frac{y}{1} + \frac{1}{\sum_{i=1}^{n-1} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1}} \left( \sum_{i=1}^{n-1} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1} \right)^{-1}, \]
where \( l = 1, 2, \ldots, n-1 \). For \( l = n \) we have
\[ x_n = \frac{y}{1} + \frac{1}{\sum_{i=1}^{n-1} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1}} \left( \sum_{i=1}^{n-1} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1} \right)^{-1}. \]  
(43)

Combining (42) and (44) we get
\[ x_n = \frac{y}{1} + \frac{1}{\sum_{i=1}^{n} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1}} \left( \sum_{i=1}^{n} \left( \frac{p_i \alpha_i}{p_i \alpha_i} \right)^{\rho - 1} \right)^{-1} \]
(45)

Since (41), (43) and (45) prove the claim (iii), Theorem 5 is completely proved. **Q.E.D.**

Let us now consider the utility maximization problem in case of Cobb-Douglas utility function for \( n > 2 \):
\[ \max_{x_1, \ldots, x_n>0} \quad \mu^{C-D}(x_1, \ldots, x_n) = A x_1^{\alpha_1} \cdots x_n^{\alpha_n}, \quad \text{s.t.} \quad p_1 x_1 + \cdots + p_n x_n = y. \]  
(46)

**Theorem 6.** The maximum utility in problem (46)-(47) is equal to
\[ \mu_{\max}^{C-D} = A \left( \sum_{i=1}^{n} \frac{\alpha_i}{p_i} \right)^{\sum_{i=1}^{n} \alpha_i}, \quad \Box \]  
(48)

and it is achieved for the unique global maximizer \( x_1^{*C-D}, \ldots, x_n^{*C-D} \), where
\[ x_k^{*C-D} = \frac{\alpha_k y}{p_k}, \quad k = 1, 2, \ldots, n. \]  
(49)

Note: If \( \sum_{i=1}^{n} \alpha_i = 1 \), then (48) and (49) can be written in a simplified form as
\[ \mu_{\max}^{C-D} = A y \prod_{i=1}^{n} \left( \frac{\alpha_i}{p_i} \right)^{\alpha_i}, \]  
(50)

\[ x_k^{*C-D} = \frac{\alpha_k y}{p_k}, \quad k = 1, 2, \ldots, n. \]  
(51)

**Proof.** By mathematical induction over \( n \geq 2 \). The idea is the same as in the proof of Theorem 5, where the claim (i) holds as shown in Theorem 4. **Q.E.D.**

**Remark 1.** If \( \sum_{i=1}^{n} \alpha_i = 1 \), then Cobb-Douglas utility function is a limit of CES utility function as \( \rho \) approaches to zero, i.e.
\[
\lim_{\rho \to 0} A \left( \sum_{i=1}^{n} \alpha_i x_i^\rho \right)^{\frac{1}{\rho}} = A \prod_{i=1}^{n} x_i^{\alpha_i}.
\]  
(52)

Proof. Let
\[
L = \lim_{\rho \to 0} \left( \sum_{i=1}^{n} \alpha_i x_i^\rho \right)^{\frac{1}{\rho}}.
\]
(53)

By taking logarithm of (53) and using the L’Hospital rule, we get
\[
\ln L = \lim_{\rho \to 0} \frac{\ln \left( \sum_{i=1}^{n} \alpha_i x_i^\rho \right)}{\rho} = \left( 0 \over 0 \right) = \lim_{\rho \to 0} \frac{\sum_{i=1}^{n} \alpha_i x_i^\rho \ln x_i}{\rho} = \sum_{i=1}^{n} \alpha_i \ln x_i
\]
\[
= \sum_{i=1}^{n} \alpha_i \ln x_i.
\]
(54)

Thus, \( L = \prod_{i=1}^{n} x_i^{\alpha_i} \) which proves Remark 1. Q.E.D.

**Remark 2.** If \( \sum_{i=1}^{n} \alpha_i = 1 \), then (50) is a limit of (32) as \( \rho \) approaches to zero, i.e.
\[
\lim_{\rho \to 0} A y \left( \sum_{i=1}^{n} \alpha_i x_i^{p_i^{-1}} \right)^{\frac{1}{p_i}} = A y \prod_{i=1}^{n} \left( \frac{\alpha_i}{p_i} \right)^{\alpha_i}.
\]
(55)

Proof. It is sufficient to prove that
\[
L = \lim_{\rho \to 0} \left( \sum_{i=1}^{n} \alpha_i x_i^{p_i^{-1}} \right)^{\frac{1}{p_i}} = \prod_{i=1}^{n} \left( \frac{\alpha_i}{p_i} \right)^{\alpha_i}.
\]
(56)

By taking logarithm and by using L’Hospital rule, we get
\[
\ln L = \lim_{\rho \to 0} \frac{\ln \left( \sum_{i=1}^{n} \alpha_i x_i^{p_i^{-1}} \right)}{\rho} = \left( 0 \over 0 \right) = \lim_{\rho \to 0} \frac{\sum_{i=1}^{n} \alpha_i x_i^{p_i^{-1}} \ln x_i}{\rho} = \sum_{i=1}^{n} \alpha_i \ln x_i
\]
\[
= \sum_{i=1}^{n} \alpha_i \ln x_i.
\]
(57)

Thus, \( L = \prod_{i=1}^{n} \left( \frac{\alpha_i}{p_i} \right)^{\alpha_i} \). This proves Remark 2. Q.E.D.

**Remark 3.** If \( \sum_{i=1}^{n} \alpha_i = 1 \), then (51) is a limit of (33) as \( \rho \) approaches to zero, i.e.
\[
\lim_{\rho \to 0} \frac{y}{\sum_{i=1}^{n} p_i \left( \frac{p_i}{p_i} \right)^{\frac{1}{p_i}} \alpha_i} = \frac{\alpha_i y}{p_k}
\]
(58)

for all \( k=1,2,\ldots,n \). 

Proof.
\[
\lim_{\rho \to \infty} \frac{y}{\sum_{i=1}^{n} p_i \left( \frac{p_i \alpha_k}{p_k \alpha_i} \right)^{1-\rho}} = \frac{y}{\sum_{i=1}^{n} p_i \cdot \frac{p_k}{p_i} \cdot \frac{\alpha_i}{\alpha_k}} = \frac{\alpha_k y}{p_k},
\]
for all \( k=1,2,\ldots, n \).
