

## ZYGAENIDAE (LEPIDOPTERA) IN THE LEPIDOPTERA COLLECTIONS OF THE CROATIAN NATURAL HISTORY MUSEUM

MARTINA ŠAŠIĆ<sup>1</sup>, ANA NAHIRNIĆ<sup>2</sup> & GERHARD M. TARMANN<sup>3</sup>

<sup>1</sup>Department of Zoology, Croatian Natural History Museum, Demetrova 1, HR-10000 Zagreb, Croatia

<sup>2</sup>National Museum of Natural History, Tsar Osvoboditel Blvd 1, BG-1000 Sofia, Bulgaria

<sup>3</sup>Tiroler Landesmuseen, Ferdinandeum, Naturwissenschaftliche Sammlungen, Feldstrasse 11a, A-6020 Innsbruck, Austria

Šašić, M., Nahirnić, A. & Tarmann, G. M.: Zygaenidae (Lepidoptera) in the Lepidoptera collections of the Croatian Natural History Museum. *Nat. Croat.*, Vol. 25, No. 2., 233–248, 2016, Zagreb.

We examined 581 specimens from the family Zygaenidae (Lepidoptera) from the Balkans and the surrounding area (Croatia, Macedonia, Serbia, Slovenia) in the collections of Croatian Natural History Museum in Zagreb. Almost all species occurring in Croatia are represented in the collections of the Croatian Natural History Museum. Despite the small number of specimens stored in this museum Zygaenidae of Croatia are well studied comparing with other countries of the Balkan Peninsula.

**Key words:** Lepidoptera, Zygaenidae, Balkan Peninsula, Croatian Natural History Museum, collection

Šašić, M., Nahirnić, A. & Tarmann, G. M.: Zygaenidae (Lepidoptera) u zbirkama leptira Hrvatskoga prirodoslovnog muzeja. *Nat. Croat.*, Vol. 25, No. 2., 233–248, 2016, Zagreb.

Pregledan je 581 primjerak leptira iz porodice Zygaenidae iz zbirkii leptira Hrvatskoga prirodoslovnog muzeja sa šireg područja Balkana (Hrvatska, Makedonija, Srbija, Slovenija). U zbirci su pohranjene sve vrste koje su zastupljene u fauni te porodice u Hrvatskoj. Unatoč relativno malom broju primjera u zbirkama, porodica Zygaenidae u Hrvatskoj je dobro istražena u usporedbi s drugim dijelovima Balkanskog poluotoka.

**Ključne riječi:** Lepidoptera, Zygaenidae, Balkanski poluotok, Hrvatski prirodoslovni muzej, zbirka

### INTRODUCTION

The Croatian Natural History Museum was founded in 1846 and from that time it collects, purchases, cares and studies natural treasures from Croatia and neighbouring countries. Today it houses about 2 million specimens systematized in more than 100 collections.

The Lepidoptera collection has about 90 000 specimens organized in ten collections. Burnets and forester moths (Zygaenidae) have never been systematically collected because of limited interest to this family and possibly because of their known resistance to cyanide, which was a standard method for collecting butterflies and moths. Therefore, only a limited number of specimens are held in our collection. A part of this collection has already been reported in Kučinić *et al.* (1994), MLADINOV (1958, 1965, 1967, 1976, 1978).

Faunistic papers on Lepidoptera of Croatia which include Zygaenidae have been published throughout the two previous centuries. Early data are e.g. included in Abafí-Aigner et al. (1896, 1910), BOHATSCH (1892), CARRARA (1846), DUPONCHEL (1844 [1846]), HAFNER (1994), LEDERER (1853), MANN (1857, 1867, 1869), SCHWINGENSCHUSS & WAGNER (1925), STAUDER (1920; 1921), VUKOTINOVIC (1879) while recent results come mainly from anecdotal observations (KRANJČEV, 1985; KUČINIĆ, 1998; MLADINOV, 1965, 1978; HABELER 2003). Only a few papers deal entirely with this group in Croatia (STAUDER, 1921, 1930–1932, RAUCH 1981).

Natural history collections act as repositories and play a vital role in understanding biodiversity. As habitat loss is one of the greatest threats to biodiversity today and collections provide data on these changes our aim was to collect all the available data on this family group in Croatia as a part of „Zygaenidae of the Balkan Peninsula“ project in order to facilitate future work on this insect group.

Zygaenidae are extremely stenoecious insects and are therefore good indicator species for environmental changes. They can show us perfectly whether a biotope is in a good ‘natural’ condition or somehow disturbed or even contaminated (TARMANN, 2004). Special studies on this topic have been undertaken in northern Italy in Val Venosta (Vinschgau) (TARMANN 2000a, 2000b, 2009) where it has been shown that species of the genera *Adscita* Retzius, 1783, *Jordanita* Verity, 1946, *Rhagades* Wallengren, 1863, and *Zygaena* Fabricius, 1775, are excellent indicators of pesticide use in the intensive apple cultures. It has been shown that the poison was transported by wind into the environment but not only to the adjacent areas but also into biotopes that are kilometres away. Zygaenidae were amongst the first insects that disappeared from seemingly completely intact environment. Several of such biotopes were even Natura 2000 sites under European protection. Zygaenidae are day active and easy to observe. Together with butterflies they have proved to be perfect indicators for monitoring destructive events caused by moulting inhibitors (e.g. Dimilin, Insegar etc.) that are used against the codling moths (*Cydia pomonella* (Linnaeus, 1758)) (Tortricidae) and similar species in fruit plantations (TARMANN 2000a, 2000b). Today, in a time of intense anthropogenic impacts on ecosystems, such data allow us to understand the changes around us better, which are manifested as changes in the composition of biological diversity of an area regardless of whether they are the result of long-term research or just based on individual species.

## MATERIAL AND METHODS

We examined 581 specimens from the Balkans and the surrounding area (Croatia, Macedonia, Serbia, Slovenia) in the collections of the Croatian Natural History Museum in Zagreb. The specimens are deposited in two main collections: Central Lepidoptera collection and Collection Lorković. The number of specimens in the Central Lepidoptera Collection is 843 and together with the specimens from Collection Lorković and additional material from the fieldwork it amounts to around 1000. As the Central Lepidoptera collection originates from several older donations (ex coll. Gušić, ex coll. Koča, ex coll. Kozulić, ex coll. Locke, ex coll Grund) we provide in brackets the abbreviations of these collections and in recent material collected by museum curators the collectors are mentioned. In special cases, e.g. of father and son Igalfy, where the first name is not mentioned on the label as collector we write only Igalfy. Specimens in the Central Collection which were collected and put directly into the collection have the name of the legator and are marked as ‘coll. Central’. The Lorković collection was collected by the famous

**Fig. 1.** *Zygaena osterodensis* Reiss, 1921, specimen from ex coll. Koča, CNHM.

Croatian lepidopterologist Zdravko Lorković and is abbreviated as 'coll. Lorković' as well as the material collected by Dragan Rucner is abbreviated as 'coll. Rucner'.

In the case where museum material could be connected with the published material the reference of the publication is given in brackets. The identification of species is based on habitus and genitalia examination. Genitalia slide numbers are placed in square brackets and were done mainly by Lidija Mladinov and by the second author. When genitalia of *Z. purpuralis* were not placed in Euparal on slide they were placed in small tubes filled with glycerol. The systematics follows EFETOV & TARMANN (1999) and HOFMANN & TREMEWAN (1996).

## RESULTS AND DISCUSSION

The analysed collections of Zygaenidae comprise 24 species (with 581 specimens) of which 10 species with 97 specimens belong to the subfamily Procridinae and 14 species with 484 specimens to Zygaeninae. The majority of the specimens of the *Z. purpuralis* complex from the collection are included in this list but examination of genitalia of some specimens, essential for a proper determination, had to be postponed.

The examined species originate from the following six countries: Bosnia and Herzegovina 4 (15 specimens), Croatia 22 (452), Macedonia 3 (4), Montenegro 5 (29), Serbia 2 (3) and Slovenia 9 (78). *J. budensis* published in MLADINOV (1958) collected by Valjavec on 12.07.1923 is not deposited in the collection and could not be verified.

*J. budensis* published by Koča (1901) from Križpolje is *J. globulariae* (see below) but the second record from Brinje could not be traced. As this second specimen was collected at the same date we doubt that it is *J. budensis*.

## List of the species:

### Family ZYGAENIDAE Latreille, 1809 Subfamily Procriinae Boisduval, 1828

#### 1. *Theresimima ampelophaga* (Bayle-Barelle, 1808)

**HR:** Vinkovci 19.06.1908. ex coll. Koča 1 m

#### 2. *Rhagades pruni* ([Denis & Schiffermüller], 1775)

*Rhagades pruni pruni* ([Denis & Schiffermüller], 1775)

**HR:** Bosiljevo ex coll. Kozulić 1 m

Klek 03.08.1916. ex coll Gušić 1 m

Vinkovci 12.07.1908. ex coll. Koča 1m

#### 3. *Adscita statices* (Linnaeus, 1758)

*Adscita statices statices* (Linnaeus, 1758)

**HR:** Bjelolasica (Velika Kapela) 1500 m 23.07.1954. leg. Z. Lorković, coll. Lorković 1 m

Boljara (=Boljare) (Žumberak Mt.), VL 26, 4.07.1995. leg. M. Vajdić

Podvrh 13.06.1972. leg. L. Mladinov 2 m 4 f [578] (MLADINOV, 1976)

Prebold 23.07.1965. leg. L. Mladinov gen. det. L. Mladinov 1 m

#### 4. *Adscita geryon* (Hübner, 1813)

*Adscita geryon orientalis* (Alberti, 1938)

**HR:** Bosiljevo ex. coll. Kozulić det. Mladinov 1 m [596]

*Adscita geryon* was mentioned by REBEL (1910) for 'Dalmatien' and by STAUDER (1921) for 'Küstenland Istrien' and 'Dalmatien' without exact locality. So far, no specimens could be found by us in collections from Croatia except that mentioned in this paper. *Adscita geryon* is surprisingly rare in Croatia. The only confirmed record (by genitalia dissection) from a locality near the Slovenian border does not seem to match the true distribution of this species in Croatia. *A. geryon orientalis* was described from the Bosnian Mountains (Makljen pass) but must occur in more parts of the Dinaric Alps. However, this has to be confirmed in future.

### **5. *Adscita manpii* (Lederer, 1853)**

**12. *Zygena cynarae* (Esper, 1789)**

*Zygena cynarae cynarae* Esper, 1789

**HR:** Gornje Čučerje (Zagreb) 01.07.1990. leg. Z. Lorković coll. Lorković 1 m

***Zygena cynarae adriatica* Burgeff, 1926**

**HR:** Bosiljevo ex coll. Kozulić 1 m  
Caska (Pag) 25.06.1962. leg. L. Mladinov 1 m  
Krk Jezero 17.06.1998. leg. M. Kučinić 1 m  
Zadar 1887 1 m, 1890 1 m, both ex coll. Locke

**13. *Zygena brizae* (Esper, 1800)**

*Zygena brizae brizae* (Esper, 1800)

**SRB:** Sonta 16-17.06.1985. leg. Z. Lorković coll. Lorković 2 m

This record is significant since *Z. brizae* is very rare in Serbia (JAKŠIĆ & RISTIĆ, 1999;  
NAHIRNIĆ et al., 2012).

**14. *Zygena purpuralis* (Brünnich, 1763)**

*Z. purpuralis purpuralis* Brünnich, 1763

**HR:** Bosiljevo, ex. coll. Kozulić 1 m 1 f [969]

In the region *Z. purpuralis purpuralis* occurs in Pannonian Basin. This is the only known record of the nominotypical subspecies in Croatia. As there are no records for the continental Croatia except for Zagreb area we suppose that this subspecies occurs in Slavonia with the contact zone with *Z. purpuralis lathyri* in Central Croatia.

*Zygaena purpuralis lathyri Boisduval, 1828*

 Srobotnik 14.06.1981 leg. L. Mladinov coll. Central 1 f

This subspecies occurs mainly in the mountain regions of the Dinaric Alps. Specimens are robust, hairy and dark, with broad hindwing border, males tend to have reduced distal end of streak (3+5). NAUMANN *et al.* (1983) published the only reliable records on the presence of *Zygaena purpuralis* in Croatia, all based on genitalia morphology. They conclude that *Zygaena purpuralis* is the only species of the *purpuralis-minos-diaphana*-group present in the northern and central Balkans.

As *Z. minos* ([Denis & Schiffermüller], 1775) is present in neighbouring countries Hungary, Bosnia & Herzegovina (NAUMANN *et al.*, 1983) and Montenegro (NAHIRNIĆ & TARMANN, 2013), its presence is also expected in Croatia, even so very local.

### 18. *Zygaena osterodensis* Reiss, 1921

*Zygaena osterodensis curvata* Burgeff, 1926

**HR:** Ruševo 09.06.1897. ex coll. Koča 1 f

*Zygaena osterodensis* occurs in three different subspecies in Croatia, *Z. o. curvata* Burgeff, 1926, *Z. o. ladina* Holik, 1944 and *Z. o. koricensis* Reiss, 1922. In Croatia *Z. osterodensis* was collected on Dilj planina near Ruševo village in Slavonia (Koča, 1901), Josipdol (MANN, 1867) and Planik, Ćićarija Mt (REBEL, 1924). The specimen from Ruševo in the Croatian Natural History Museum derives from same material as the date is the same as from Dilj in Koča (1901) (Fig. 1). This population belongs to *Z. o. curvata* that is distributed in eastern Austria, Hungary, eastern Slovenia and Slavonia in Croatia. STAUDER (1921) also mentions *Z. osterodensis* from Istria and Dalmatia, but in his later paper (STAUDER, 1930-1932) he does not mention this species any more from Dalmatia. Moreover, exact localities and source from STAUDER (1921) are not known and no specimens have been located in collections. The specimen From Planik (REBEL, 1924) is deposited in the collection of the Naturhistorisches Museum Wien, Austria, with the label – Planik, Istria, 6. July 1913, collected by Rudolf Kitschelt. This female specimen belongs to *Z. o. ladina*, a population group that is distributed in the south-eastern Alps and in western Slovenia including Istria. The population from Josipdol should belong to the Balkan subspecies *Z. o. koricensis* but this cannot be proved at the moment as Mann's original material on what his record is based has not been traced in collections so far. However,

the northernmost known locality of this subspecies in Bosnia and Herzegovina is Drvar and this locality is only 15 km away from the Croatian border. We can therefore assume that *Z. o. koricnensis* also occurs in Croatia. *Z. o. koricnensis* is known from the Dinarid mountains starting from northern Bosnia and Herzegovina (or Croatia if Josipdol can be confirmed) southwards to Baba Mt. and Galičica Planina in Macedonia, but also in southern and eastern Serbia and Bulgaria. We have no records from *Z. osterodensis* from Croatia for about 100 years. Although, this species is very local and rare in the surrounding countries, it should not be considered as extinct from Croatia but it has to be re-confirmed by newer field research.

## CONCLUSION

Almost all species occurring in Croatia are represented in the collections of the Croatian Natural History Museum. Despite the small number of specimens stored in this museum Zygaenidae of Croatia are well studied if compared with other countries of the Balkan Peninsula. As the majority of papers deal with the coastal area of Croatia (Dalmatia), this collection is valuable since there are specimens from other areas. The comparison of new field observations with historical data allows us to comment on changes in the distribution of species. These changes can have their origin in a natural shift of species areal, lack of field work (not sufficient studies undertaken) or in events like described above (true destruction events in habitats).

*Received May 9, 2016*
