THE EARLY ABBASID DINARS OF THE PETROVCI HOARD

UDC 904:737.122.1(439.24) "7"
Original scientific/scholarly paper

The Petrovci hoard is a small deposit consisting of 9 Islamic dinārs issued by several caliphs who were early rulers of the 6Abbāsids dynasty as well as a gold torque and one gold ear-ring with two pearls. Despite its limited size the Petrovci hoard is a very important phenomenon, partly because the number of European finds containing early Islamic dinārs is extremely small.

The Catalogue of the coins is arranged in columns. Underneath the name of the dynasty and ruler in the first column is the coin number. The second column is to identify the mint that struck the respective dinār. Since all specimens of the hoard are anonymous, the column does not contain any mint name. Column three contains the dates of coinage according to the Islamic calendar (AH= Anno Hegirae) and its equivalent according to the Christian calendar (AD= Anno Domini) obtained from Wüstefeld's conversion tables1. Column four specifies the coin weight, diameter and die axis (Obv. : Rev.). The last column contains the Arheološki Muzej in Zagreb's inventory numbers, description of both sides of the coin, references to literature and secondary individual data of a particular specimen if needed. This method of presenting the numismatic material has been applied by the present author in several previously published articles2.

The following description and analysis of the hoard coins are based on a study of their photographs. I am greatly indebted to Ivan Mirk of the Arheološki Muzej in Zagreb for providing me with these photographs, as well as other materials containing data on the hoard and enabling me to publish this paper.

**COMMENTARY**

Dīnār is a gold Islamic coin that evolved from the Byzantine solid. The name itself originated in Latin (*denarius*). Until the end of VIIth century the weight of the dīnār was 4.25 g, but later on it ranged from 3.20 to 4.75 g. It was the dīnār that was the first pure epigraphic coin of the Muslim empire.

The numismatic material of the Petrovci find is very homogeneous in terms of the depicted variants. The coins have standard ʿAbbāsid legends containing conventional parts being quotations from the Qurʿān, completed with dates following the Islamic lunar calendar. The order of legends in the field and margin of both sides is everywhere the same. The epigraphy used is also of the same style with only some letters having been ornamented in a special way. The only difference, apart of course from the chronology of a particular coin, is the appearance of pellets and the name (cf. No. 9). The field legend of the Obverse is as follows

لا الإال
لا وحده
لا شريك له

"There is no god but God alone. He has no associate." Cf. Qurʿān, surah 47:21 (47:19) and 6:163.

The marginal legend of the Obverse contains fragments from surahs 48:29 and 9:33

محمد رسول الله ارسله بالهدى ودين الحق ليظهره على الدين كله

"Muhammad is the messenger of God. He sent him with the guidance and the religion of truth to make it prevail over every religion."

The Reverse field represents a quotation from surah 48:29

محمد
 رسول
 الله

"Muhammad is the messenger of God."

The marginal legend of the Reverse contain the date formula

بسم الله ضرب هذا الدينار سنة ...

Belonging to the early emissions of the Caliphate, the dinārs of the find, as has been mentioned before, do not have mint names mentioned in their legends. The mints start to be indicated on dinārs from 198 AH. However, judging by the fact that the majority of earlier emissions were issued in Madinat as-Salām (i.e. Baghdad) and Misr, we can suppose the earlier gold coins to have been struck there also.

All specimens of the find in question belong to rather common ʿAbbāsid emissions. The most frequent ones, struck between 150 and 160 AH are not included in the hoard. These types of coins were so widely accepted in the Mediterranean and the adjacent territories that they became imitated with the aim of using them on local as well as foreign markets. One can mention here as an example the Anglo-Saxon dinārs of King Offa.

The specimens of the hoard make a very coherent group as far as the dates of their emissions are concerned. Only one coin (No. 1) loses touch with the others. The chronology of the remaining ones is situated between 163 AH = 779/80 AD and 172 AH = 788/89 AD. Consequently, the year 788 AD has to be accepted as terminus post quem. However, in setting up the exact date of burial of the whole deposit one should consider all other existing circumstances, including the context of the find.

If the 136 AH dinār is taken into consideration, the span between the oldest and the youngest coin of the hoard runs to 35 years. If this coin is excluded, the span becomes as small as 9 years.

Specimen No. 1 was struck in 136 AH. This is the last year of the reign of the first ʿAbbāsid caliph Abū al-ʿAbbās ʿAbd Allāh as-Saffāh and the first year of the reign of his half-brother and successor, Abū Gaṭfar ʿAbd Allāh al-Manṣūr. For this reason it is difficult to call any of them the ruler the coin was issued by. As is shown in the catalogue part of this paper the earliest dinār of al-Manṣūr mentioned by H. Lavoix was struck in 140 AH. W. Tiesenhausen put the 136 AH dinār together with other emissions of al-Manṣūr. A. Markov did not mention such coins struck during the reign of al-Manṣūr at all, while H. Nützel described such a dinār among as-Saffāh’s issues. The Iraqi author an-Naqšbandī included the gold emissions of 136 AH among as-Saffāh’s ones, too. The coin itself is an example of a standard ʿAbbāsid dinār with its semblance and the order of legends.

There are no pellets that were a characteristic trait of the later issues, helpful in fixing the chronology of some imitations of the 6Abbāsid dinārs. It is also worth considering the shape of the letter dāl in the name محمد in the Obverse's first line. N. Lowick, who commented on this matter, came to the conclusion that this letter on the early dinārs is much shorter than on the later ones. The evidence of the Petrovci board seems to confirm this statement.

The next 5 coins in the find are dinārs issued during the reign of the caliph Abū 6Abd Allāh Muhammad al-Mahdī, son of al-Manṣūr. The earliest one is the specimen struck in 163 AH (No. 2). This piece exemplifies the middle phase of al-Mahdī's rule, when the Islamic Caliphate struggled with the Byzantine empire, and at the same time intensively developed its economy including the intensification of the coinage. This is why the dinārs issued in 160s AD belong to the most common ones. The legends of this coin do not differ from those of the previously described specimen. What should be underlined here is the pellets that are placed in variable positions of the coin. It is supposed that pellets appeared as a result of a template as an aid to the engravers of dies of coins. Unfortunately, only some of the references quoted here pay attention to that phenomenon. The coin in question is close to the variant registered by Nützel, but the Petrovci dinār has an additional pellet above the letter ر in the word لیظهره.

Dinārs No. 3 and No. 4 were struck in 165 AH. They are, however, of two variants of dies. The first one has no pellets at all. The references used here say nothing about this element except Nützel's work where this fact is underlined. Instead, the second coin has pellets on both sides, on Obv. after رسول and above لیظهره and on Rev. in the centre.

Specimen No. 5 differs from all variants specified by the authors of the references quoted here as far as the pellets and their location are concerned. While the pellets of the Obverse are nothing special, three pellets appearing in such an order as on the Reverse of the specimen in question are not the most common.

The 167 AH dinār (No. 6) has no exact counterpart mentioned in any reference quoted here. Its Obverse seems to be the same as the Reverse of the specimen listed in Lavoix's work, but the author does not mention any special feature of the Obverse. The Petrovci dinār has a pellet above ر in لیظهره (cf. above).

Another specimen (No. 7) bears the date 168 AH what means that it was struck during the last period of the reign of al-Mahdī. The special feature of this coin is the double pellet below the letter ١ as well as a pellet after ١.

The coin No. 8 is a specimen that have never been issued during the rule of either al-Mahdī or his son, Abū Muḥammad Mūsā al-Hādī. W. Tiesenhausen adds that the 169 AH dinār could have been struck by the successor of al-Mahdī. H. Lavoix allows for the same possibility, but on the other hand does not mention al-Hādī's dinārs issued in 169 AH. There is also a double pellet below the letter ١ as is the case for the above mentioned specimen.

The caliph Abū Ga’far Ḥārūn ar-Raṣīd, son of al-Mahdī and brother of al-Hādī, is a sovereign whose coinage is represented by the dinār issued in 172 AH (No. 9). This is the specimen whose importance lies in several factors. First of all, this is the only dinār of the Petrovci hoard that shows any difference from the point of view of inscriptions. The difference is in the name همسي Mūsā that appears beneath the kalimah of the Reverse. Then, at the same time it is the case that seems to confirm N. Lowick's opinion about the scarcity of pellets on the 6Abbāsid dinārs struck in the last

13. V. TIESENHAUSEN 1873: 115.
decades of the II century of the Muslim era. N. Lowick convincingly argues that these are additional inscriptions that gradually resulted in the elimination of pellets. Finally, there are some assumptions as to the place where it was struck. The name Mūsā refers to Mūsā ibn ʿIsā who held important posts during the rule of al-Manṣūr, al-Mahdi and ar-Raṣīd. In 171 AH he was appointed governor of Egypt and in 172 AH he was dismissed and appointed governor of al-Kūfah and then Damascus. Taking into consideration both the date of issue of the coin and the fact that Mīsā was in Egypt that year, we may suppose that the coin was struck right there. This opinion can be supported by the statement of M. Broome who points out that some ʿAbbāsid gold struck between 171 and 187 AH has the names of viziers or governors of Egypt.

The dinār of ārūn ar-Raṣīd has another significant feature that should be mentioned here. This coin weighs much less than any other specimen found in the Petrovci hoard. For the purpose of comparison Table 1 shows the weights of the Petrovci dinārs and the weights of the specimens listed in some references. As anyone can see, the weight of the dinār was rather stable over the whole period in which the specimens described here were struck. There are, of course, some exceptions to the rule and first of all our dinār of Hārūn ar-Raṣīd should be mentioned. What is very interesting is that the coin bears no trace of damage. This is nothing strange for the good state of preservation is another characteristic trait for the deposit in question. There are some incisions on the surface of some specimens but it is difficult to decide whether they occurred deliberately or not. Maybe only the cut on coin No. 8 could be regarded as made for the purpose of checking the quality of the gold or indicating this particular specimen.

In the light of the given data it seems to be probable that the complex of coins could have been assembled somewhere in the territory of the Caliphate or Byzantine empire. The fact that could support such an explanation is the main core of the monetary part of the hoard. Its coherence, and the presence of only one coin that was issued much earlier than the remaining ones, allows one to consider as-Saffāḥ's dinār an accidental admixture. After then the coins could have been gathered with the jewellery still on the territory of the Byzantine empire or later on in the Petrovci area. Coming back to the question of establishing the approximate date of the deposit's concealment one must admit here to difficulties. N. Lowick shows for how long anonymous dinārs of the post-reform type circulated. In some cases such a period can be assessed at about two or more centuries. On the other hand the good condition of the Petrovci hoard dinārs seems to support the opinion that these coins had not been in circulation for a long time before being buried in the soil. The study on the hoard as a complex consisting of different objects can explain what territories ought to be taken into account. This may be only a hypothesis but according to the present author such a possibility cannot be completely ruled out.

15. N. LOWICK 1990: 174-175.
18. The jewellery found in the Petrovci hoard is described as a Byzantine product of the late Avarian period (the end of VIII century) which corresponds to the chronology of the coins of the deposit in question; cf. Tesori nazionali della Croazia. Capolavori dei Musei di Zagabria, Arheološki Muzej, Arezzo-Basilica Inferiore di San Francesco, 7 Settembre-20 Ottobre 199. Arezzo, 1991: 187-188: Centro Affari e Promozioni.
19. N. LOWICK 1990: 175; the Ramla hoard of dinārs which was buried after 368 AH= 979 AD contained specimens struck between 143-188 AH.
