A CONTRIBUTION TO THE VASCULAR FLORA OF THE SLATINA REGION

DRAGAN PRLIĆ

University of Osijek, Department of Biology, Osijek, Croatia
(dprlic@biologija.unios.hr)

Prlić, D.: A contribution to the vascular flora of the Slatina region. Nat. Croat., Vol. 21, No. 1., 21–48, 2012, Zagreb.

Floristic research in the area of Slatina and its surroundings was conducted during the period March–October, 2009–2010. The last complete species list dates back to 1957 and refers specifically to the town of Slatina. It provides 398 taxa of which 5 have been given a particular Red List category, but only 1 has been confirmed with the latest research.

The new research has revised the old data and expanded the area of investigation to surrounding villages, approximately 60 km² in total. Many of the previously recorded taxa have not been found, but with the new ones added to the list, the final number was 550 taxa: 524 species and 26 subspecies classified into 334 genera and 94 families. Of the total number of taxa, 12 belong to Pteridophyta and 538 to the Spermatophyta division, with the *Asteraceae* family the largest.

According to the Red Book of Vascular Flora of Croatia and Flora Croatica Database, 25 species have been given a certain IUCN Red List status and numerous taxa are protected by the law (105 protected, 29 strictly protected). Taxa with an IUCN status have been analyzed in detail regarding their sites of occurrence, causes of threat and population density. Some of the notable findings include: *Carex riparia* Curtis, *Cyperus glomeratus* L., *Hibiscus trionum* L., *Hottonia palustris* L., *Pseudolysimachion longifolium* (L.) Opiz and several species within the *Orchidaceae* family.

Key words: flora mapping, Slatina and surroundings, threatened taxa, Red List

Prlić, D.: Prilog vaskularnoj flori grada Slatine i okolice. Nat. Croat., Vol. 21, No. 1., 21–48, 2012, Zagreb.

Istraživanje flore na području grada Slatine i okolice provedeno je u periodu od ožujka do listopada tijekom 2009. i 2010. godine. Posljednja cijelokupna florna lista izrađena je 1957. i odnosi se isključivo na grad Slatinu. Dotična lista broji 398 svojih od čega 5 pripada određenoj kategoriji ugroženosti, no samo je potvrđena u najnovijem istraživanju.

Novim istraživanjem obavljena je korekcija florne liste te je istovremeno prošireno područje istraživanja na okolna sela, ukupne površine od oko 60 km². Mnoge ranije забиљежене svojte ovim istraživanjem nisu potvrđene, no dodatkom novih, lista je ažurirana i broji 550 svojih: 524 vrste i 26 podvrsta raspoređeno u 334 roda i 94 porodica. Od ukupnog broja, 12 svojih ulazi u odjeljak Pteridophyta, a preostalih 538 u Spermatophyta, s porodicom *Asteraceae* kao najbrojnijom.

Prema Crvenoj knjizi vaskularne flore Hrvatske i online bazi Flora Croatica Database, 25 svojih posjeduje određeni status prema Crvenoj listi IUCN-a dok je znatan broj zakonom zaštićen (105 zaštićenih, 29 strogo zaštićenih). Svojte s IUCN statusom detaljno su obrađene u smislu njihova nalazišta, uzroka ugroženosti i gustoće populacije. Valja spomenuti nekolicinu vrijednih nalaza: *Carex riparia* Curtis, *Cyperus glomeratus* L., *Hibiscus trionum* L., *Hottonia palustris* L., *Pseudolysimachion longifolium* (L.) Opiz te nekoliko vrsti iz porodice *Orchidaceae*.

Ključne riječi: kartiranje flore, Slatina i okolica, ugrožene svojte, Crvena lista

INTRODUCTION

The region of Slatina spreads across the central part of Virovitica-Podravina County (Fig. 1.) with total area of 156 km² at coordinates 45° 42" N and 17° 42" E with an average relief elevation of 127 m. The region contains 15 settlements: Bakić, Bistrice, Donji Meljani, Golenić, Gornji Miholjac, Ivanbrijeg, Kozice, Lukavac, Markovo, Medinci, Novi Senkovac, Radosavci, Sladojevački Lug, Sladojevcvi and the town of Slatina.

Detailed mapping of the flora in the stated area has not been performed recently. Therefore, new investigations on-site are necessary to confirm previously found taxa and supplement the list with the latest data. The existent species list (NOVKOVIC, 1957) dealt specifically with the town of Slatina. It was created in a period when anthropogenic influence was present on a smaller scale, which is perhaps the main reason that the certain threatened taxa have not been confirmed by the latest research. Later field observations in the region supplemented the flora to a certain extent.

Because of the urban expansion and construction, much of the meadow and forest land has been put to arable use and consequently many taxa have not been confirmed, including those threatened to a certain degree. In line with such environmental impacts, new field investigations were conducted during the period of 2009–2010 on a frequent basis, regarding the areas of Bistrice, Donji Meljani, Radosavci, Sladojevački Lug, Sladojevcvi and the town of Slatina. This research resulted in many newly found taxa and also in detailed site descriptions, photo-documentation and a critical view of the threatened taxa. The data gathered in this investigation will provide a basis for future comparison and will enable population monitoring of Red List species.

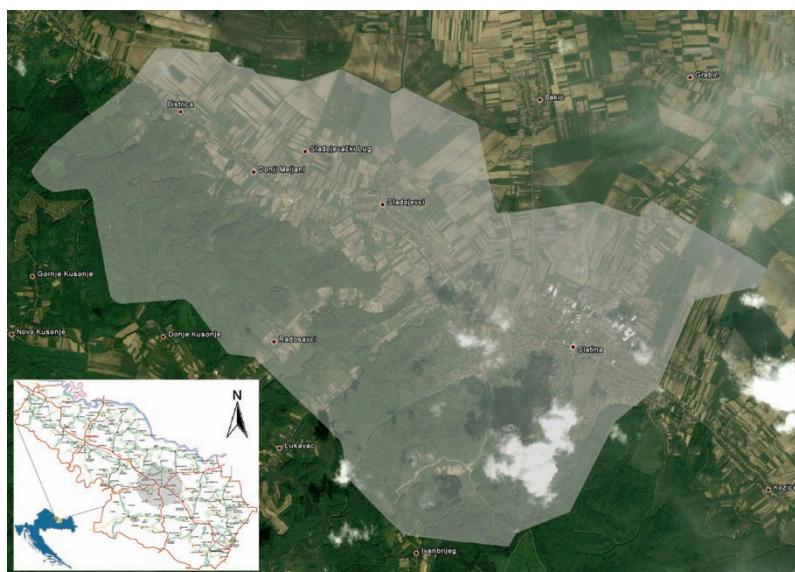

Fig. 1. The investigated area of the Slatina region within Virovitica-Podravina County.
(STIPANIĆ *et al.*, 2006; Google Earth)

STUDY AREA

The region of Slatina is bordered by the Drava River to the north and slopes of Mt Papuk to the south. The northern part of the region is characterized by arable lowlands where the contour lines run from 100 to 120 m. Further to the south, the land gradually develops into higher terrain, eventually mountainous, with relief elevations up to 1000 m. The mountainous region, which is prolific with stream valleys, extends in the northwest to southeast direction. No strict natural borders are distinguished in the eastern and western parts of Slatina (STIPANIĆ *et al.*, 2006).

The climate is moderate continental with an average annual temperature of 11.3 °C and 726.4 mm of average annual precipitation. Summers are usually warm with an average temperature of 20.8 °C, whereas the winter temperature average is 1.3 °C. Most precipitation occurs in September with 90.9 mm on average, while January and February, with average values of 39.5 mm and 34.1 mm respectively, present the least precipitation. The measurements were taken during the period 2000–2008 (Meteorological and hydrological service, 2009).

Out of the total area (156 km²), which is 7.72 % of Virovitica-Podravina County, approximately 60 km² has been investigated (Fig. 1). According to STIPANIĆ *et al.*, area structure is characterised by: 4128 ha of arable land, 310 ha of pastures, 200 ha of forest, 115 ha of orchards, 68 ha of vineyards and 38 ha of gardens.

METHODS

This research, in the main part, deals with the wild flora of the Slatina region, but also considers some cultivated species which have notably spread out of their cultivation area (i.e. spruce plantations).

The data on taxa distribution were gathered by implementing two methods: literature and field observations. The primary aim of consulting literature regarding the floristic inventory of the Slatina region was to gain an insight into existent floristic lists and taxa localities. The only complete floristic list for this area was recorded by NOVKOVIĆ (1957) who focused on the investigation of Slatina, excluding its surroundings. Floristic inventory and general sites of occurrence were provided for all taxa found at the time. Later works related to the Slatina region (MARKOVIĆ-GOSPODARIĆ, 1965; ILIJANIĆ & ŠEGULJA, 1983), mostly based on phytocenological research, provide a certain addition to the flora of Slatina and its surroundings.

Field observations consisted of taxa identification, location mapping and photo-documentation. The general aim has been to gain precise coordinates, therefore methods of direct mapping (NIKOLIĆ, 2006) were used and performed on site: a topographic map of scale 1 : 25 000 (STATE GEODETIC ADMINISTRATION) or a handheld GPS (Global Positioning System) device modified for Zone 5 (Central meridian at 15° E) of Gauss-Krüger coordinate system. Additionally, coordinates of direct mapping can be subjected to generalization and can thus be converted into a model of reduced precision (i.e. UTM or MTB grid).

In this paper a single representative coordinate is given for each taxon. For taxa with an IUCN status, all known coordinates are noted. Taxa in the floristic list have been described using the abbreviations **TM25** or **GPS** for coordinates obtained using either a topographic map or a GPS device, respectively. The number in brackets

represents GPS accuracy for the given coordinate. When toponym nomenclature was used, the topographic maps were also useful in presenting the sites of threatened taxa and creating textual descriptions regarding these sites.

During the course of field observations, the determination of plant taxa was carried out using the following keys and iconographies: DOMAC (2002), JAVORKA & CSAPODY (1991), PIGNATTI (1982), ROTHMALER (2009) and TUTIN *et al.* (1980, 1993). In the frame of the higher systematic groups, the families are listed following the classification by DOMAC (2002). Further within families are allocated genera and within genera there are species. Taxonomy has been adjusted according to the Flora Croatica Database (NIKOLIĆ, 2010). Life form abbreviations are given according to PIGNATTI (1982): **T** Therophyta, **G** Geophyta, **H** Hemicryptophyta, **Ch** Chamaephyta, **Pn** Nanophanerophyta, **P** Phanerophyta, **Hy** Hydrophyta.

Following the names of species and subspecies within the floristic list, common sites of occurrence have been given for every taxon, followed by a single representative coordinate for the same. It should also be noted that certain taxa fall into a protective category by the law (ANONYMOUS, 2009) and such are abbreviated as **P** for *Protected* and **SP** for *Strictly Protected*. The taxa under an IUCN category have been analyzed later in the text. The analysis of these species is consistent with IUCN Red List categories (NIKOLIĆ & TOPIĆ, 2005), which are noted as follows: **DD** (*Data deficient*), **EN** (*Endangered*), **NT** (*Near Threatened*) and **VU** (*Vulnerable*). These are followed by coordinates of all known localities, which are further geographically described in reference with topographic maps. Finally, possible threats and population density (where possible in numbers, otherwise an approximation) are given according to the author's perception of anthropogenic and other influences in the area of the threatened species.

RESULTS

In the course of this investigation, 550 taxa have been noted in the area of Slatina and surrounding villages: 524 species and 26 subspecies classified into 334 genera and 94 families of vascular flora (Tab. 1). Pteridophyta division counts 12 taxa and Spermatophyta 538 taxa. The three most numerous families are: *Asteraceae* with 50 taxa (9.1 %), followed by *Poaceae* with 47 taxa (8.6 %) and *Fabaceae*, counting 33 taxa (6.0 %) in total. Families with 20 taxa or less are aggregated in the category *Other* and count 300 taxa in total (Fig. 2).

Tab. 1. Flora analysis according to the systematic categories.

Scientific classification	Families	Genera	sp & ssp
Pteridophyta	6 (6.4 %)	7 (2.1 %)	12 (2.2 %)
Spermatophyta			
Gymnospermae	2 (2.1 %)	4 (1.2 %)	5 (0.9 %)
Angiospermae			
Dicotyledoneae	73 (77.7 %)	256 (76.6 %)	425 (77.3 %)
Monocotyledoneae	13 (13.8 %)	67 (20.1 %)	108 (19.6 %)
T O T A L	94	334	550

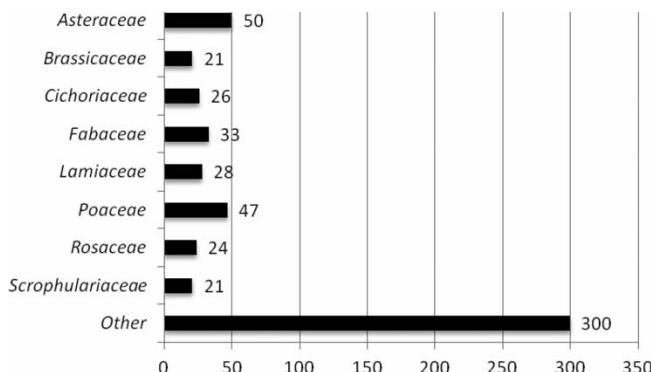

Fig. 2. Numerical distribution of taxa within families.

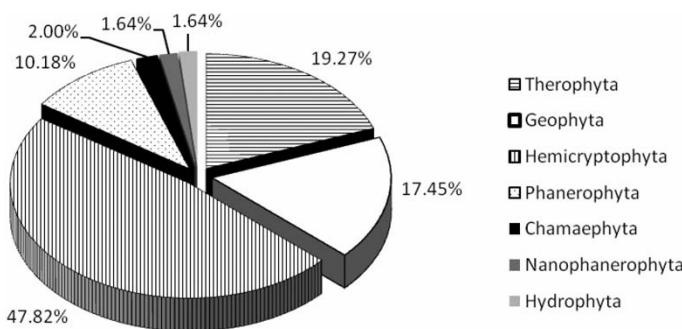

Fig. 3. Life form proportions in the investigated area.

According to the analysis of life forms (Fig. 3), Hemicryptophytes with 47.82 % present a significant domination within the life form quota. They are followed by Therophytes and Geophytes, with 19.27 % and 17.45 % respectively. Phanerophytes present a lesser share along with other life forms which are remotely present.

During field investigations, 25 species have been found which fall under a certain IUCN Red List category, of which 22 (4.0 % of total taxa) are threatened to a certain degree. *Orchidaceae*, with 5 taxa, is the most threatened of the listed families. Furthermore, 105 taxa are protected by the law and 29 taxa are declared strictly protected.

DISCUSSION

Analysis of the flora

Of the total 398 taxa found earlier by NOVKOVIĆ (1957), 95 taxa have not been confirmed in this paper. In that research, the majority of taxa belonged to *Compositae* family (*Asteraceae* + *Cichoriaceae* = 54 taxa), which is consistent with the current research where family domination is maintained (now 76 taxa). It is important to note the 5 species that are to a certain degree threatened, of which the following 4 have not been confirmed: *Ophioglossum vulgatum* L. (Near Threatened), *Fritillaria meleagris* L (Vulnerable), *Orchis morio* L. (Near Threatened) and *Cephalanthera rubra* (L.) Rich (Near Threatened). What caused the disappearance of *Cephalanthera rubra* is uncertain even though the specific forest area (*Brežić* Forest) has been investigated. The other 3 unconfirmed species were previously noted on meadows in the far northern part of the Slatina region which has not been included in this research.

Additionally, the paper did not state any coordinates for future verification nor did it otherwise describe the sites with precision. These species have not been found within the currently researched area. In contrast, only *Gentiana asclepiadea* L. has been confirmed, but there was no previous data on its population density.

Furthermore, in the phytocenological researches (MARKOVIĆ-GOSPODARIĆ, 1965; ILIJANIĆ & ŠEGULJA, 1983) a total of 93 taxa were found in the area of Donji Meljani and Slatina, of which 9 taxa have not been confirmed. Only one IUCN Red List taxa was found, *Ophioglossum vulgatum* L. (Near Threatened) in Donji Meljani, but has not been confirmed. As in the previous case, no detailed descriptions were given which would enable confirmation. The human population in Donji Meljani has increased over the years, meadows have been used as land for house building and some have been converted to arable land; such changes could have contributed to the decline or, more likely, to the extinction of this species in the local area.

Within the values for Central Europe, Hemicryptophytes, which are typical of the forest and grassland flora, occupy half of the total life form quota (ELLENBERG, 1988). The domination of Hemicryptophytes in the Slatina region (47.82 %) fits within these data, as expected. Although forests, meadows and pastures in Slatina occupy much smaller areas than arable land (STIPANIĆ *et al.*, 2006), there is an apparent quantitative value of hemicryptophytic flora. Second place is occupied by Therophyta, characteristic of steppe and semi-arid areas, which indicates the occurrence of dry periods in the study area. In conclusion, Hemicryptophytes, Geophytes and Phanerophytes, with their significant share in this paper, represent the typical life forms of Central Europe.

By comparing the dominance of life forms with the neighboring areas (Tab. 2.), the expected trend of Hemicryptophyte domination is revealed, as well as the domination of Asteraceae family as the largest in the floristic inventories.

Analysis of the threatened taxa

In this research, 25 taxa have been found which bear a certain IUCN Red list status (excluding *Least Concern* taxa, which are not noted in this paper) of which 4 are *Endangered* (EN), 8 *Vulnerable* (VU) and 10 taxa are *Near Threatened* (NT). It is important to note that a genuine risk exists for the following taxa: *Carex riparia* Curtis, *Cyperus glomeratus* L., *Hibiscus trionum* L., *Alopecurus aequalis* Sobol., *Butomus umbellatus* L. and *Dactylorhiza incarnata* (L.) Soó. In addition, 3 *Data Deficient* (DD) species, namely *Polygonum salicifolium* Brouss. ex Willd., *Stellaria palustris* Retz. and *Pseudognaphalium luteoalbum* (L.) Hilliard et B. L. Burtt, have been found as well.

In the following text, this paper provides: known localities using relative descriptions and coordinates for each of the 25 IUCN Red List taxa (including the number of individual specimens for a certain location, otherwise an approximation may be

Tab. 2. Comparative view of Hemicryptophytes and Asteraceae with the neighboring areas.

Author	Investigated area	Hemicryptophytes (%)	Asteraceae (%)
PANDŽA, 2010	Papuk Nature Park	47.73	8.83
TOMAŠEVIĆ, 2006	Požega Valley & surr. mountains	44.77	9.19
PRLIĆ, 2012	Slatina region	47.82	9.09

given), known threats and conservation suggestions. To facilitate standardization, causes of threat according to the IUCN standard classification (NIKOLIĆ & TOPIĆ, 2005) have been included with the taxon name and Red List status. Unthreatened taxa or possible threats with no supportive evidence have been treated as *Unknown*.

Alopecurus aequalis Sobol. VU IUCN standard: *Direct Loss* [2.]

GPS: (4) E5706410 N5069153

A single population has been found in a field canal in Sladojevački Lug. The canal is damp or flooded (rarely dry) with moderate population density. Current threat is canal maintenance. Conservation may prove difficult because canal maintenance is crucial to prevent floods on the arable land. It may be possible to clean out the canal selectively, leaving a small population intact.

Butomus umbellatus L. NT IUCN standard: *Habitat Loss* [1.1.1.], *Atmospheric Pollution* [4.2.]

GPS: (4) E5706279 N5070396

A small population is located on the field border (area of approximately 2 m²) south of Donji Meljani. Soil tillage and occasional drought present a certain threat, but further observations are necessary.

Carex acutiformis Ehrh. NT IUCN standard: *Unknown* [9.]

GPS: (7) E5707982 N5069851

A small patch located in the canal between *Prolom* and *Čelnjak* toponyms in Sladojevci. No known threats.

Carex praecox Schreb. NT IUCN standard: *Unknown* [9.]

GPS: (4) E5705658 N5068162

This species has been found on a wet meadow (area of approximately 1000 m²) in Sladojevci near the train station. Population is moderate to dense. Converting this meadow to arable land may present a possible future threat.

Carex riparia Curtis VU IUCN standard: *Direct Loss* [2.]

GPS: (5) E5704191 N5069517

Found in a canal in Donji Meljani among meadows and arable land (area of approximately 500 m²), which is sometimes dry during the flowering time. Population is moderate. Current threat is annual canal maintenance to prevent floods so conservation may include, as with *Alopecurus aequalis*, application of selective maintenance.

Cephalanthera damasonium (Mill.) Druce NT IUCN standard: *Unknown* [9.]

GPS: (6) E5701587 N5068641

Found only at the edge of *Sandželkovica* Forest in Bistrica. This population of 3 specimens grows on the roadside near a forest stream. There is no current threat evident to this species.

Cephalanthera longifolia (L.) Fritsch NT IUCN standard: *Unknown* [9.]

GPS: (11) E5702010 N5068596 *Sandželkovica* Forest, Bistrica

(9) E5705203 N5066437 At *Martin* Creek area, north of Radosavci. 1 specimen.

(7) E5705173 N5066469 3 specimens.

(7) E5705298 N5066511 1 specimen.

(9) E5704694 N5066151 At *Buban* toponym, north of Radosavci. 2 specimens.

(7) E5705044 N5066127 2 specimens.

(12) E5705047 N5066128 2 specimens.

(13) E5705056 N5066105 1 specimen.

TM25: E5704673 N5066068 12 specimens.

No conservation plans are necessary at this time.

Fig. 4. *Cyperus glomeratus* habitat in 2009: before and after canal maintenance.
(photo: D. Prlić)

Cyclamen purpurascens Mill. NT IUCN standard: *Unknown* [9.]
GPS: (6) E5704812 N5065838

At the forest edge near a pasture in Radosavci (at *Buban* toponym) there is a small population of 3 specimens. Roadside maintenance may present a possible threat.

Cyperus glomeratus L. VU IUCN standard: *Direct Loss* [2.]
GPS: (5) E5704204 N5069686

South of Donji Meljani; locality and threats same as for *Carex riparia*, but with a larger area of occurrence and population density moderate to dense. Despite the evident destruction of canal surface caused by maintenance (Fig. 4.), the population remained stable in 2010.

GPS: (4) E5705563 N5068301

A small population has been found in a canal close to Sladojevački Lug, about 100 m after the railroad crossing due north. About 20 m of the canal's length is taken by the species. Canal maintenance presents a likely threat.

TM25: E5705838 N5067816

Another small intermittent population is located in a canal near the main road in Sladojevci. No evident threats.

Dactylorhiza incarnata (L.) Soó EN IUCN standard: *Direct Loss* [2.]
GPS: (8) E5702609 N5068171

This species of orchids has been found on a roadside in *Markovac* Forest, south of Donji Meljani, and consisted of 2 specimens in 2009. Its location on the forest roadside makes it susceptible to roadside maintenance. In 2010 the maintenance was carried out in the early vegetation period before the flowering time, therefore no specimens have been observed since. Any conservation plan should consider excluding the locality from roadside maintenance. Further observations are necessary.

- Daphne mezereum* L. NT IUCN standard: *Unknown* [9.]
 GPS: (9) E5702367 N5068731 Bistrica, *Sandelkovica* Forest. 5 specimens.
 (8) E5702381 N5068709 Bistrica, *Sandelkovica* Forest; forest trail. 2 specimens.
 (6) E5703596 N5066731 Donji Meljani, *Živkovac* Forest; forest edge. 1 specimen.
 (5) E5703596 N5066731 Donji Meljani, *Živkovac* Forest. 7 specimens.
 (7) E5702721 N5067694 Donji Meljani, *Živkovac* Forest; forest edge. 1 specimen.
 (9) E5702585 N5067644 Donji Meljani, *Živkovac* Forest; forest roadside. 1 specimen.
 (6) E5708984 N5062598 Slatina, *Ravni gaj* forest; Forest roadside. 1 specimen.

This species can occasionally be found throughout the forest of the investigated area, therefore it is perhaps even widely spread. No evident threats.

- Digitalis ferruginea* L. VU IUCN standard: *Unknown* [9.]
 GPS: (8) E5702787 N5067831
 (10) E5703036 N5067349

This vulnerable species has only been found in Donji Meljani at the edge of *Živkovac* Forest near the roadside. Populations consist of 12 specimens in total.

- Equisetum hyemale* L. VU IUCN standard: *Unknown* [9.]
 GPS: (8) E5708415 N5064658
 Area along the forest stream in *Čojljuk* Forest, Slatina. Densely populated.
 (8) E5702860 N5066967
 A forest canal in *Živkovac* Forest, Donji Meljani. Population density is low (area of approx. 12 m²).

- Gentiana asclepiadea* L. NT IUCN standard: *Unknown* [9.]
 GPS: (7) E5709059 N5063210
 The site of occurrence is forest edge near the main road in *Mokro brdo* Forest, Slatina. Population density is low.

- Glyceria plicata* (Fr.) Fr. VU IUCN standard: *Unknown* [9.]
 GPS: (6) E5701688 N5068638 Damp ground at *Sandelkovica* Forest edge, Bistrica.
 (11) E5702881 N5066795 Damp roadside in *Živkovac* Forest, far south from Donji Meljani.
 (8) E5705622 N5067474 Damp forest edge at *Seča* Forest, Sladojevci.

Possible threats may include habitat destruction due to tractor passage in the area. Population is low at all sites.

- Hibiscus trionum* L. EN IUCN standard: *Habitat Loss* [1.1.1.], *Indirect Effects* [3.3.]
 GPS: (5) E5704267 N5069435

The location of this species has been found near the fields in Donji Meljani, west of the toponym *Loženjak*. The population is located on what used to be a meadow roadside. Since this year's maintenance of a nearby canal, there has been some soil tillage involved at the site. The bare soil that was left has been overgrown by weeds and, consequently, this species was not observed in 2010. This population of few specimens is closely located to *Carex riparia* and *Cyperus glomeratus* sites making this small area rich in Red List species and important candidates for protection.

- Hottonia palustris* L. EN IUCN standard: *Unknown* [9.]
 GPS: (9) E5702746 N5067995
 Located in a forest swamp (area of approximately 500 m²) in *Markovac* Forest, southwest of Donji Meljani. A hunting tower is located nearby, a sign that the swamp area is visited by wild game. Even so, there is no threat indication regarding this habitat or its plant population of any kind. The population is estimated at moderate density, but further investigations are necessary to confirm this because the receding of the water level exposes new specimens, most of which are very young plants.

Orchis tridentata Scop. VU IUCN standard: *Habitat Loss* [1.3.], *Direct Loss* [2.]
GPS: (4) E5704154 N5068423

It has been found on cemetery lawn and in surrounding scrub (area of approximately 600 m²) in Donji Meljani at the toponym *Radlovac*. There are two existing threats regarding this area, one of which is enlargement of the cemetery. However, considering that the current expansion is slow, and that most of the population inhabits the surrounding scrub where expansion is impracticable, it is concluded that the population will remain intact for the most part. The other threat is presented by lawn mowing which is performed at least once a year. In 2010 it was carried out in the flowering period of the species. Current population consists of 55 specimens, of which 1 is an albino form. With the population majority (45 specimens) in the intact scrub, strict conservation may not be needed at this time.

Platanthera bifolia (L.) Rich. VU IUCN standard: *Unknown* [9.]
GPS: (7) E5701585 N5068627 Bistrica, *Sandelkovica* Forest; forest trail. 2 specimens.

- (8) E5701409 N5068472 1 specimen.
(8) E5701401 N5068643 2 specimens.
(10) E5701518 N5068749 1 specimen.
(12) E5703659 N5066765 Radosavci, *Živkovac* Forest; forest edge. 1 specimen.

No known threats.

Poa palustris L. NT IUCN standard: *Unknown* [9.]
GPS: (5) E5702825 N5067494 Forest edge in *Živkovac* Forest, south of Donji Meljani.
(13) E5702108 N5068646 Forest edge in *Sandelkovica* Forest, Bistrica.
(10) E5702903 N5066711 Forest roadside in *Živkovac* Forest, far south from Donji Meljani.

No known threats. Low population at all sites.

Polygonum salicifolium Brouss. ex Willd. DD IUCN standard: *Unknown* [9.]
GPS: (6) E5702886 N5066731
A forest ditch in southern *Živkovac* Forest, west of Radosavci. The population is moderate with no known threats.

Pseudognaphalium luteoalbum (L.) Hilliard et B.L.Burtt DD IUCN standard: *Direct Loss* [2.]
GPS: (8) E5711088 N5065908
It has been found on the south side of the main building at the train station in Slatina, growing from a crack in the building foundation. Station maintenance presents a genuine threat. All specimens were cut from their habitat in 2010 during flowering time. In a later period, new specimens were observed, but in lesser numbers. Informing and instructing the maintenance staff may consequently protect the poor population at the site.

Pseudolysimachion longifolium (L.) Opiz EN IUCN standard: *Direct Loss* [2.]
GPS: (5) E5705502 N5068198
Donji Meljani, a canal near the road to Sladojevački Lug. Current threat is canal maintenance; the canal's banks were mowed in 2010 during the flowering period.

GPS: (4) E5705658 N5068162
Sladojevci, a meadow near the train station. Conversion to arable land presents a possible threat.

GPS: (4) E5705986 N5069414
Field border between the toponyms *Loženjak* and *Livadka*, Sladojevački Lug.
GPS: (4) E5706291 N5070382
A canal at the toponym *Dakinac*, north of Sladojevački Lug.
Populations at all sites range from low to moderate.

Ruscus hypoglossum L. NT IUCN standard: *Unknown* [9.]

GPS: (6) E5702724 N5068317 Donji Meljani, *Markovac* Forest; forest trail.

(7) E5703060 N5068215 Donji Meljani, *Markovac* Forest.

(6) E5709390 N5063070 Slatina, *Mokro brdo* Forest; forest edge along the main road.

TM25: E5701587 N5068383 Bistrica; *Sandžkovica* Forest.

In this paper only four localities are noted, but this species is frequent throughout the forest area. No known threats.

Stellaria palustris Retz. DD IUCN standard: *Unknown* [9.]

GPS: (5) E5703022 N5069381 Wet soil near the soil escarpment in central Bistrica.

(5) E5704405 N5069305 A meadow north of Donji Meljani.

Both populations estimated at moderate density. No threats.

The analysis of the causes of threat for the investigated area (Fig. 5.) shows that for the most taxa threats are unknown or nonexistent. The main reason for that are the forest sites where anthropogenic influence is minimal. Additionally, other species populate areas that are of little interest (e.g. scrub) and therefore remain unthreatened.

Regarding the threatened species, the main cause is human influence and mechanization. Given that many species are located in areas subject to regular maintenance, the largest share among the causes of threat belongs to *Direct Loss*, contrary to *Habitat Loss* which is the leading cause in Croatia (NIKOLIĆ & TOPIĆ, 2005). Loss of habitat is in second place and generally refers to soil tillage where threatened species are located.

The indication that 57.1 % of species are unthreatened, or that the causes are not known, means the flora of the Slatina region is relatively safe and that, for the majority, a protection plan is not required. For taxa subject to direct loss from land maintenance, excluding a part of the locality from the maintenance process may prove necessary for conservation. This requires legislative decisions, since most taxa are on property of public interest. For some species, communication and education may prove sufficient in their conservation as in the example of *Pseudognaphalium luteoalbum* (L.) Hilliard et B. L. Burtt for which cutting is the sole cause of threat.

It should also be noted that there are certain species that do not have a formal conservational status, but are of rare occurrence in the investigated area. Within Pteri-

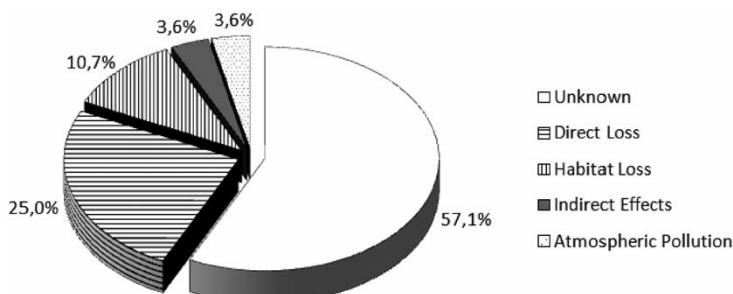

Fig. 5. Share of established causes of threat for the Slatina region.

dophyta, such a species is *Equisetum ramosissimum* Desf., which has a single known location, in Sladojevački Lug. Some rare-occurring Spermatophyta are *Carlina vulgaris* L., *Dorycnium herbaceum* Vill., *Medicago falcata* L., *Aconitum lycoctonum* L., *Helianthemum nummularium* (L.) Mill., *Saxifraga bulbifera* L., *Saxifraga tridactylites* L., *Epilobium parviflorum* Schreber, *Odontites vulgaris* Moench, *Scabiosa ochroleuca* L., *Buphthalmum salicifolium* L.

It is suggested that the condition and population size should be monitored in future research, especially of those on the Red List.

Prilog vaskularnoj flori grada Slatine i okolice

D. Prlić

Posljednja inventarizacija flore navedenog područja napravljena je prije 53 godine. Nova istraživanja provedena su tijekom 2009. i 2010. godine, u razdoblju od ožujka do listopada, u smislu inventarizacije i kartiranja biljne raznolikosti na području grada Slatine i okolice. Uz kartiranje provedeno pomoću GPS uređaja i topografske karte, izvršena je i fotodokumentacija svojti. Tako je istraživanjem područja od oko 60 km^2 utvrđena prisutnost 524 vrste i 26 podvrsta u ukupno 334 roda i 94 porodice. Među navedenima, po životnom obliku najveći dio zauzimaju hemikriptofiti (263 svojte), dok prema porodicama, od ukupnog broja vaskularne flore istraženog područja, većina pripada porodici *Asteraceae* (50 svojti), a zatim slijede *Poaceae* (47 svojti) te *Fabaceae* (33 svojte).

Tijekom novog istraživanja, posebno je istaknuta obrada ugroženih svojti. Prema Crvenoj knjizi vaskularne flore Hrvatske i online bazi Flora Croatica Database, istraživanjem slatinskog područja utvrđeno je 25 svojti koje nose određenu IUCN kategoriju (osim LC – najmanje zabrinjavajućih). Ugrožene su 4 svojte, gotovo ugroženih je 10, dok status osjeljivih ima 8 svojti. Kategoriji nedovoljno poznatih pripadaju 3 svojte. Također, prema hrvatskom zakonu, utvrđena je prisutnost 105 zaštićenih te 29 strogo zaštićenih svojti. Glede uzroka ugroženosti, najveću prijetnju predstavlja izravan gubitak s 25 %, dok je značajnih 57,1 % neugroženo ili ugroženost nije trenutno poznata. Zbog učestalog antropogenog utjecaja, važno je naglasiti stvarnu opasnost za sljedeće vrste ovoga područja: *Carex riparia* Curtis, *Cyperus glomeratus* L., *Hibiscus trionum* L., *Alopecurus aequalis* Sobol., *Batumus umbellatus* L. te *Dactylorhiza incarnata* (L.) Soó.
