### Sažetak

Pregledom dostupne literature i prilikom florističkog istraživanja (2005.-2006. god.) vaskularne flore na području Pantan u blizini grada Trogira (srednja Dalmacija), zabilježeno je sveukupno 269 svojti koje su svrstane u 178 rodova i 61 porodicu. Od toga broja tijekom ovog istraživanja utvrđeno je novih 177 svojti. Od ukupnog broja svojti njih 107 ili 39% pripada skupinama mediteranskog flornog elementa, među kojima su najbrojnije općemediteranske biljke. Dominantnost mediteranskog flornog elementa, velik broj svojti iz porodice Fabaceae (40 svojti), te broj terofitskih (121 svojta ili 45%) vrsta govori o mediteranskom karakteru istraživanog područja. Na istraživanom području zabilježena je kritično ugrožena vrsta (CR) *Aeluropus litoralis* (Gouan.) Parl., ugrožene vrste (EN): *Carex extensa* Gooden. i *Glaucium flavum* Crantz, osjetljive vrste (VU): *Desmazeria marina* (L.) Druce, *Hainardia cylindrica* (Willd.) Greuter, *Salsola soda* L. i *Suaeda maritima* (L.) Dumort.

**Ključne riječi:** vaskularna flora, biljna raznolikost, Pantan, Dalmacija, Hrvatska

## Abstract

By checking the available literature data and during the floristic research (2005-2006) of the vascular plants of the Pantan territory in the vicinity of Trogir (central Dalmatia), a total number of 269 taxa were recorded. 177 taxa were recorded for the first time and classified into 178 genera and 60 families. A total number of 107 taxa or 39% of them belong to a group of the Mediterranean floristic elements, of which the most numerous are circum-Mediterranean plants. The dominance of the Mediterranean floristic element, a great number of taxa from the *Fabaceae* family (40 taxa) and a number of Therophytes (121 taxa or 45%) shows the Mediterranean character of the study area. There were also noticed critically endangered species (CR) *Aeluropus litoralis* (Gouan.) Parl., endangered species (EN): *Carex extensa* Gooden. and *Glaucium flavum* Crantz, vulnerable species (VU): *Desmazeria marina* (L.) Druce, *Hainardia cylindrica* (Willd.) Greuter, *Salsola soda* L. and *Suaeda maritima* (L.) Dumort.

**Key words:** vascular flora, plant diversity, Pantan, Dalmatia, Croatia

## Introduction

The territory of Pantan in the vicinity of Trogir in central Dalmatia (UTM grid XJ01 and XJ02) was proclaimed a special ornitho-ichthyological reserve on December 19, 2000 by the Assembly of the Splitsko-Dalmatinska County, in accordance with the Ministry of environmental protection (Gabelica et al. 2011). Pantan reserve is situated in the western part of the Kaštela field (Fig. 1). Besides being a special nature reserve, it is also a cultural and historical monument because of the old renaissance mill which is located there. The surface of the Pantan reserve is approximately 40 hectares (Gabelica et al. 2011). Geologically it is characterized by limestone and sandstone layers that connect joined there, and on the connection line there is a spring of fresh water called Rika (Žanić 2005). According to the historical reports on January 23, 1496 there was a strong earthquake near Trogir and as a consequence the lake was formed at the foot of the hill Krban, out of which the stream Rika flows (Žanić 2005). During the centuries around the area where the Rika enters the sea, swampy tract similar to a small lagoon was formed, which was afterwards shaped by man. Pantan is a typical Mediterranean coastal wetland, which makes habitat for a great number of swamp fish and bird species. As far as we know from the available literature data, botanical researches of this area have never been made systematical and a complete floristic list of this area doesn't exist.

According to the phytogeographical classification of the eastern Adriatic coast, Pantan is situated on the northern border of the central district in the central eumediterranean area (Horvatić 1963a). Information about the flora and vegetation of the Pantan territory can be found in Visiani (1841-1881), Slade-Šilović (1914), Bedalov & Šegulja in Cvitanić (1998), Šegulja (1998), Šakić & Lozančić (1999), Kamenjarin & Pavletić (2002), and in the NHMS Herbarium of Andrija Andrić that is deposited in the Natural History Museum in Split (abbreviation according to Thiers 2015).

Floristic research started in 2005 and lasted one year, and all vegetation seasons were included. Results of our field research, without a floristic list, were presented by Gabelica et al. (2007) on the 2<sup>nd</sup> Croatian Botanical Congress. Meanwhile, some authors (Ruščić 2010, Ruščić et al. 2010, Jasprica & Kovačić 2011) provided contributions to the flora of the Pantan area but also without a complete floristic list. Therefore, the aim of this research was to contribute a floristic list of the investigated area of Pantan reserve because there was discrepancy in the number of vascular plant taxa in different publications.

Figure 1. Geographical position of the Pantan territory.

## Material and methods

During the years 2005 and 2006 systematic botanical research of the Pantan territory near Trogir was conducted. It was carried out by the Public institution for managing of protected natural values on the territory of Splitsko-dalmatinska County and by teachers of the 5<sup>th</sup> Gymnasium "Vladimir Nazor", with the help of students who attended classes of Biology as an optional subject. In this research standard floristic methods were applied according to Nikolić et al. (1998).

Plant parts were collected for determination and the great majority of plants in the stage of inflorescence and fruit were photographed with digital camera. Herbarium specimens were identified by the standard keys (Tutin et al. 1964-1980, Pignatti 1982, Tutin et al. 1993, Domac 1994). The nomenclature follows Flora Croatica Database (Nikolić 2015) and taxa are listed in the context of higher systematic groups in alphabetical order of families. Threatened taxa are defined according to Nikolić & Topić (2005).

After the name of each taxon there is the abbreviation of the author who registered the taxon in this territory for the first time: Visiani (V), Andrić (A), Slade-Šilović (SŠ), Bedalov and Šegulja (BŠ), Šakić and Lozančić (ŠL), Kamenjarin and Pavletić (KP).

Life forms were determined according to Horvat (1949) and Pignatti (1982), while the symbols are given according to Horvat (1949): **Ch**-Chamaephytes, **G**-Geophytes, **T**-Therophytes, **H**-Hemicryptophytes, **P**-Phanerophytes, **I**-Hydrophytes. Floristic elements were determined according to Horvatić (1963b) and Horvatić et al. (1967/68) as follows:

1. Cultivated and adventitious plants
2. Euro-Asian floristic element
3. European floristic element
4. Mediterranean floristic element
  - 4.1. Circum-Mediterranean plants
  - 4.2. Eastern-Mediterranean plants
  - 4.3. European-Mediterranean plants
  - 4.4. Illyrian-Mediterranean plants
    - 4.4.1. Illyrian-Adriatic plants
      - 4.4.1.1. Illyrian-Adriatic endemic plants
      - 4.4.1.2. Illyrian-Apennine plants
    - 4.5. Mediterranean-Atlantic plants
    - 4.6. Mediterranean-Pontic plants
    - 4.7. Western-Mediterranean plants
5. South-European floristic element
  - 5.1. South-European-Atlantic plants
  - 5.2. South-European-Mediterranean plants
  - 5.3. South-European-Pontic plants
6. Widely spread plants

## Results and discussion

The vascular flora of the Pantan territory has 269 taxa, and a floristic list is reported here for the first time in totally. Previously reported number of 360 vascular plant taxa by Ruščić (2010), Ruščić et al. (2010) and Nikolić (2015) was not possible to confirm and identify because of lack of the adequate floristic list.

## Taxonomic analysis

In this work 177 new plant taxa were recorded in the Pantan territory and the total number of registered taxa in now 269. There are altogether 61 families of vascular plants, and most of them belong to the group *Dicotyledones* (216 taxa). Then follows the group *Monocotyledones* with 10 families (50 taxa), *Coniferopsida* with one family (two taxa), and the group *Pteridophytes* with one family (one taxon). The family represented by the highest number of taxa is *Fabaceae* with 40 taxa and then follow the families *Poaceae* (25 taxa), *Asteraceae* (18 taxa) and *Cichoriaceae* (17 taxa).

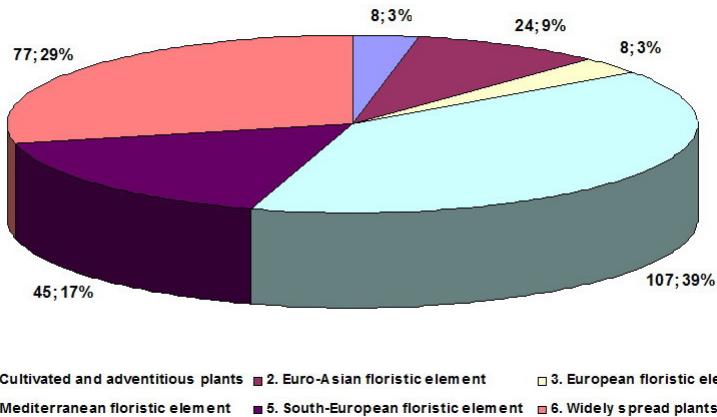

Previously reported taxa *Galium maritimum* and *Fritillaria orientalis* were probably incorrectly determined and in our field research we did not find any of them.

## Analyses of floral elements and life forms

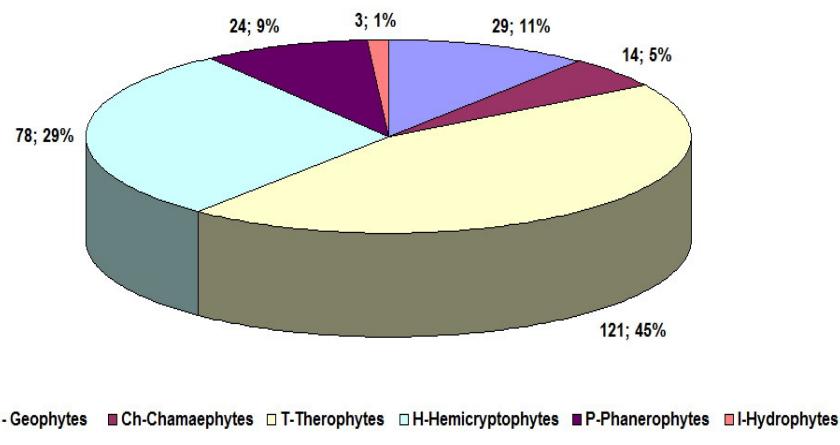

According to the floristic elements (Fig. 2), the best represented floristic elements are given below: Mediterranean (107 taxa), South-European (45 taxa), Eurasiac (24 taxa), European (eight taxa), widely spread plants (77 taxa), cultivated and adventitious plants (eight taxa). In the context of the Mediterranean floristic element the best represented are the circum-Mediterranean plant taxa (75 taxa), and in the context of the South-European floristic element the best represented are the South-European-Mediterranean plant taxa (33 taxa).

The plant taxa that have IUCN threat categories according to Nikolić & Topić (2005) that occur on the Pantan territory is critically endangered species (CR) *Aeluropus litoralis* (Gouan.) Parl., endangered species (EN) are *Carex extensa* Gooden. and *Glaucium flavum* Crantz, vulnerable species (VU) are *Desmazeria marina* (L.) Druce, *Hainardia cylindrica* (Willd.) Greuter, *Salsola soda* L. and *Suaeda maritima* (L.) Dumort.

The analyses of life forms (Fig. 3) show the the most represented are *Therophytes* (121 taxa), followed by *Hemicryptophytes* (78 taxa), *Geophytes* (29 taxa), *Phanerophytes* (24 taxa), *Chamaephytes* (14 taxa) and *Hydrophytes* (three taxa).

## Conclusion

During the years 2005 and 2006 a systematic botanical research of the Pantan territory near Trogir was carried out. The result is a floristic list that currently consists of 269 vascular plant taxa classified into 178 genera and 59 families. 177 new taxa were recorded for the first time. The dominance of Mediterranean floristic elements, many taxa from the *Fabaceae* family (40 taxa), and high number of therophytes (121 taxa) documents the Mediterranean character of the research territory.
