**Milović, M. (2015): A new contribution to the knowledge of the vascular flora of the Krka National Park (North Dalmatia, Croatia). Glas. Hrvat. bot. druš. 4(1): 22-29.**

**Abstract**

The most recent research of the vascular flora of the Krka National Park was conducted in the period from 2010 to 2015. 105 plant taxa, new for the flora of the Park, were recorded. Alongside 1080 previously recorded, the complete vascular flora of the Park now consists of more than 1180 taxa and represents more than 20 % of the total Croatian flora. Among the recorded taxa, five are endemic: *Onosma stellulata*, *Ophrys liburnica*, *Peltaria alliacea*, *Thymus bracteosus* and *Vincetoxicum hirundinaria* ssp. *adriaticum*. Five taxa are considered as

threatened: *Vaccaria hispanica* (CR), *Ophrys apifera* (EN), *Urtica pilulifera* (EN), *Orchis provincialis* ssp. *pauciflora* (VU) and *Orchis tridentata* (VU). The most of non-native taxa, recorded in this study, are casual garden escapes but three of them are considered to be invasive plants in Croatia: *Abutilon theophrasti*, *Datura innoxia* and *Solidago gigantea*. In the upcoming period, special attention should be given to *S. gigantea* because of its possible spread in habitats along the river banks.

**Keywords:** endemic plant species, garden escapes, invasive plants, river of Krka, threatened plants

**Milović, M. (2015): Novi prilog poznavanju vaskularne flore Nacionalnog parka Krka (Sjeverna Dalmacija, Hrvatska). Glas. Hrvat. bot. druš. 4(1): 22-29.**

**Sažetak**

Nova istraživanja vaskularne flore Nacionalnog Parka Krka obavljena su u razdoblju od 2010. do 2015. Zabilježeno je 105 vrsta i podvrsta novih za floru Parka. Zajedno s prethodno zabilježenim svojstama, ukupna flora u Parku je sada više od 1180 svojih što je više od 20% ukupne flore Hrvatske. Među novozabilježenim svojstama je pet endema: *Onosma stellulata*, *Ophrys liburnica*, *Peltaria alliacea*, *Thymus bracteosus*, *Vincetoxicum hirundinaria* ssp. *adriaticum*. Pet svojstava ima jednu od kategorija ugroženosti: *Vaccaria hispanica* je kritično ugrožena

(CR), *Ophrys apifera* i *Urtica pilulifera* su ugrožene (EN), a *Orchis provincialis* ssp. *pauciflora* i *Orchis tridentata* su osjetljive svojte (VU). Od stranih svojih prevladavaju povremeni prebjeci iz kulture, ali su pronađene i tri svojstava koje se smatraju invazivnim u Hrvatskoj (*Abutilon theophrasti*, *Datura innoxia* i *Solidago gigantea*). Uočena je opasnost od mogućeg invazivnog širenja svojstava *S. gigantea* na staništima uz obale rijeke.

**Ključne riječi:** endemi, invazivne biljke, prebjeci iz uzgoja, rijeka Krka, ugrožene biljke

**Introduction**

The Krka National Park is situated in Croatian littoral, in the southern part of the northern Dalmatia (Fig. 1). The river of Krka between the old fortresses Trošenj and Nečven to Šibenik Bridge, including the lower course of the Čikola tributary, were proclaimed a national park in 1985 with the total area of 142 km<sup>2</sup>. In 1997, the boundaries

and area of the park were revised. The park was shifted more to the upper course of the river and now embraces an area extending approximately from the town of Knin to the town of Skradin. Consequently, the total area of the Park has been reduced and now comprises 109 km<sup>2</sup>.

Although the Krka River was proclaimed as a national park due to its geomorphologic and hydrological values, this area also exhibits exceptional botanical richness and was identified as Important Plant Area (IPA) in Croatia (Milović 2010). The first serious research of the flora of the river Krka and its surroundings began in the early 19th century (Visiani 1826, 1842–1852) and has continued until today (Marković et al. 1993, Milović & Mitić 2009, Sedlar et al. 2010). In the period between 1989 and 1991, extensive research of the vascular flora was carried out, resulting in the first comprehensive floristic list containing in total 860 plant taxa (Marković et al.

1993). In addition, a detailed overview of floristic and vegetation surveys conducted until 1990 was also presented. The floristic findings thereafter (Milović 2007, Milović & Mitić 2009, Sedlar et al. 2010), following the boundary changes in 1997, have been analysed by Milović & Mitić (2009) and Sedlar et al. (2010) resulting in a total of 1080 plant taxa.

The most recent field research conducted in the period from 2010 to 2015 resulting in a significant number of new records of vascular plants for the Krka National Park is presented in this study.

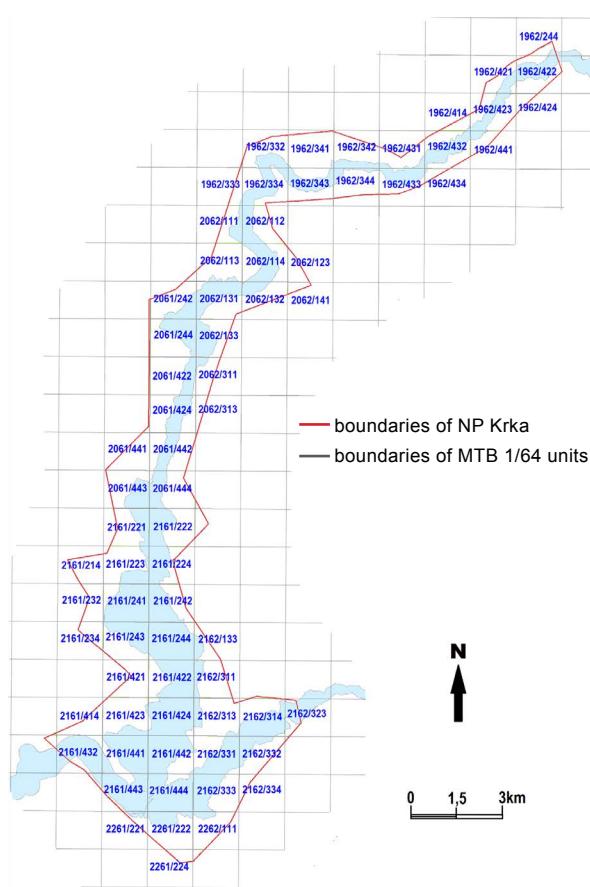

**Figure 1.** Geographical position and boundaries of the Krka National Park.

## Material and methods

Field surveys were conducted from 2010 to 2015 in the whole area of the Park. Taxa were determined using the standard determination keys, books and guides: Tutin et al. (1968–1980, 1993), Pignatti (1982), Domac (1994), Delforge (2006). Taxa that have been found only in cultivation are not taken into account. The nomenclature used follows Nikolić (2016a). The taxa in the list are given in alphabetical order of genera and species. Names of taxa (species, subspecies and family)

are followed by the codes of their associated MTB 1/64 units. Basic MTB 1/64 units approximately form rectangles with average measurements of  $1,5 \times 1,4$  km and average area of  $2,1 \text{ km}^2$ . GPS receiver GARMIN eTrex Vista HCx and 1:25 000 topographic maps were used for determination of the position and boundaries of the mapping units. The study area is comprised of 71 MTB 1/64 units (Fig. 2).

**Figure 2.** The Krka National Park with MTB 1/64 unit codes.

Endemic taxa were defined according to Nikolić et al. (2015) and the threatened taxa according to Nikolić & Topić (2005) and Nikolić (2016b). Strictly protected plants are identified those listed in the Ordinance on Strictly Protected Species (Anonymous 2013). The category „invasive plants“ were attributed to the taxa included in the Preliminary check-list of invasive alien species in Croatia proposed by Boršić et al. (2008). Terminology dealing with residence time of alien plants (archaeophytes / neophytes) and with degree of its naturalisation (casual, naturalised and invasive) are used from Richardson et al. (2000). The data of geographic origin of the alien species are taken from Pignatti (1982) and Celesti-Grapow et al. (2009). These information are provided in the column Remarks in Table 1.

Plant taxa that have been previously recorded by Marković et al. (1993), but on localities outside the recent boundaries of the Park (in the area southern of Skradin Bridge) are marked with an asterisk (\*).

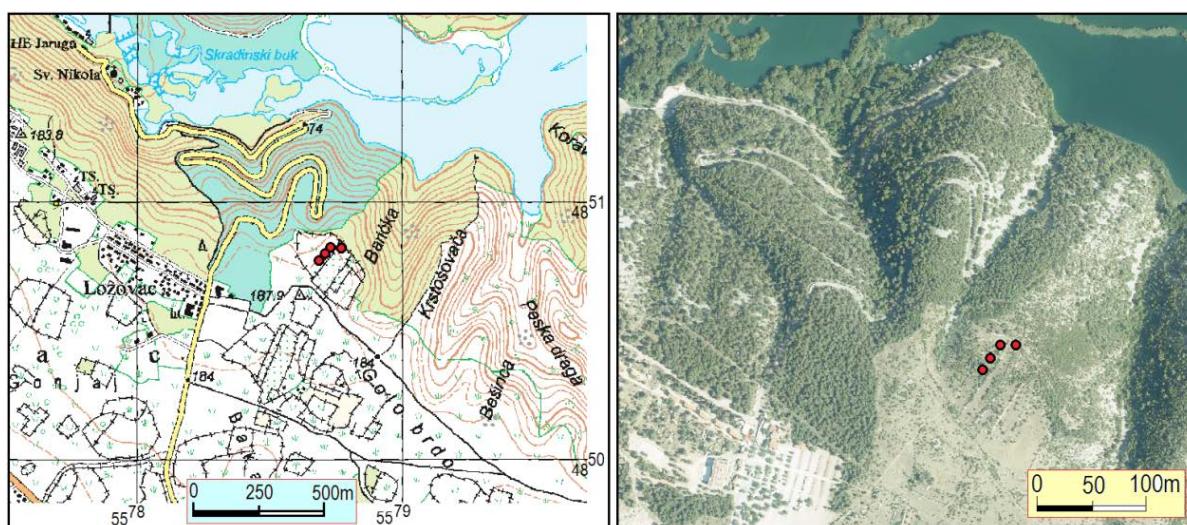

## Results and discussion

In this study 105 new records of vascular plant taxa for the Krka National Park were presented (Table 1). Among them, four taxa were identified to the subspecies level (*Carex flacca* Schreb. ssp. *flacca*, *Consolida regalis* S.F. Gray ssp. *paniculata* (Host) Soó, *Pastinaca sativa* L. ssp. *urens* (Req. ex Godr.) Čelak and *Picris hieracioides* L. ssp. *hieracioides*), and are therefore listed as new for the Park, although they have been registered before by Marković et al. (1993) and Sedlar et al. (2010) at species level. Eleven of registered plant taxa have been previously recorded by Marković et al. (1993) but on localities outside the recent boundaries of the Park (Tab1).

Among all, the presence of four endemic taxa (*Onosma stellulata*, *Peltaria alliacea*, *Thymus bracteosus*, *Vincetoxicum hirundinaria* ssp. *adriaticum*) and one stenoendemic species (*Ophrys liburnica*) must be stressed.

The Red List category Critically Endangered (CR) was assigned to one species (*Vaccaria hispanica*) and categories Endangered (EN) and Vulnerable (VU) were assigned to two species each: *Ophrys apifera* (EN), *Urtica pilulifera* (EN), *Orchis provincialis* ssp. *pauciflora* (VU) and *Orchis tridentata* (VU). In addition, four taxa (*Anacamptis pyramidalis*, *Himantoglossum adriaticum*, *Orchis laxiflora* ssp. *laxiflora* and *Peltaria alliacea*) were considered as Near Threatened (NT) and *Vincetoxicum hirundinaria* ssp. *adriaticum* was classified as of Least Concern (LC).

*Himantoglossum adriaticum* (Orchidaceae) is on the list of plant species protected by the Bern Convention (Anonymous 1996) and by Habitats Directive Annex II and IV (Anonymous 2004). Several individuals of this orchid were found in the area of Žurića Brdo (MTB 2161/441), but a large population of approximately 300 individuals was found in 2015 on dry grassland, northeastern of the Park entrance near the village of Lozovac (MTB 2261/222) (Fig. 3).

**Figure 3.** The village of Lozovac – site of the large population of *Himantoglossum adriaticum*, on topographic map 1:25 000 and ortho-photo map 1:5 000.

Among the recorded taxa, 24 are considered to be non-native, nine were archaeophytes and 15 neophytes. The most of archaeophytes has been deliberately introduced into the cultivation but nowadays often occur outside of culture as casual garden escapes (*Lactuca sativa*, *Raphanus sativus*, *Ricinus communis* and *Ziziphus jujuba*) as well as fully established plants (*Morus nigra*, *Prunus cerasus* and *Satureja hortensis*).

The most neophytes are casual garden escapes (*Albizia julibrissin*, *Calendula officinalis*, *Cerastium tomentosum*, *Ipomoea purpurea*, *Melia azederach*, *Oxalis articulata*, *Solanum lycopersicum*, *S. tuberosum*, *Tagetes patula* and *Zea mays*). Three are considered to be invasive in Croatia (*Abutilon theophrasti*, *Datura innoxia* and *Solidago gigantea*).

In the study area, *A. theophrasti* and *D. innoxia* were found to grow on anthropogenic habitats in settlements and their surroundings, but *S. gigantea* was found on wet meadows and abandoned areas along the riverbanks and has a much greater potential of invasive spread. *Solidago gigantea* has long been known as an invasive plant in the continental part of Croatia, while it is very rare in the Croatian

coastal area (Nikolić et al. 2014). The plant was found at two sites in the northeastern part of the Park (below locality of Tanjina glava and in the area of Liver) in the summer of 2015. At both sites, populations consist of 100-200 individuals. These two localities in the Krka National Park, along with two previously recorded sites in area of Tijarica (Plazibat 2002) and in surroundings of Vrgorac (Vukojević & Vitasović-Kosić 2012), are the only finding sites of *S. gigantea* in Dalmatia.

### Conclusion

During this research 105 records of plant taxa new for the Krka National Park were recorded whereas the total number of taxa of its flora now increased to over 1180, which represents more than 20 % of Croatian flora. New findings of alien species recorded in this study indicate the potential risk of invasive spread of some of them into the area of the national park which can endanger its fragile ecosystems, particularly in the coastal area along the river.

86.	<i>Solanum villosum</i> Mill. ssp. <i>alatum</i> (Moench) Dostál	<i>Solanaceae</i>	2261/224	-
87.	<i>Solidago gigantea</i> Aiton	<i>Asteraceae</i>	1962/433; 1962/422	neophyte; invasive; North America
88.	<i>Tagetes patula</i> L.	<i>Asteraceae</i>	2161/243; 2262/111	neophyte; casual garden escape; South America
89.	<i>Tanacetum parthenium</i> (L.) Sch.Bip.	<i>Asteraceae</i>	1962/432; 2161/243	neophyte; casual garden escape; West Asia
90.	<i>Thymus bracteosus</i> Vis. ex Benth.	<i>Lamiaceae</i>	2161/214; 2161/221	endemic; strictly protected
91.	<i>Tordylium maximum</i> L.	<i>Apiaceae</i>	1962/343; 2061/422; 2062/114; 2062/132; 2161/442	-
92.	<i>Trifolium striatum</i> L. ssp. <i>tenuiflorum</i> (Ten.) Arcang.	<i>Fabaceae</i>	1962/432; 1962/441	-
93.	<i>Urtica pilulifera</i> L.	<i>Urticaceae</i>	2061/443; 2061/444	Endangered (EN) and strictly protected
94.	<i>Vaccaria hispanica</i> (Miller) Rauschert	<i>Caryophyllaceae</i>	2162/323	Critically Endangered (CR) and strictly protected
95.	<i>Valerianella dentata</i> (L.) Pollich	<i>Valerianaceae</i>	2261/222	-
96.	<i>Velezia rigida</i> L.	<i>Caryophyllaceae</i>	2161/424; 2261/222	-
97.	<i>Vicia faba</i> L.	<i>Fabaceae</i>	2162/334; 2262/111	in culture and subsppontaneously
98.	<i>Vicia lutea</i> L.	<i>Fabaceae</i>	2062/114; 2062/132; 2161/244	-
99.	<i>Vicia narbonensis</i> L.	<i>Fabaceae</i>	2161/441	-
100.	<i>Vinca major</i> L.	<i>Apocynaceae</i>	2161/243; 2162/333	-
101.	* <i>Vincetoxicum hirundinaria</i> Medik. ssp. <i>adriaticum</i> (Beck) Markgr.	<i>Asclepiadaceae</i>	1962/244; 1962/424; 2061/442; 2062-311; 2161-244; 2162/331	endemic; Least Concern (LC) and strictly protected
102.	<i>Viola tricolor</i> L.	<i>Violaceae</i>	2161/441	in culture and subsppontaneously
103.	<i>Zannichellia palustris</i> L.	<i>Zannichelliaceae</i>	1962/343; 2062/114	-
104.	<i>Zea mays</i> L.	<i>Poaceae</i>	1962/342; 1962/344; 1962/423; 1962/433; 2161/214; 2161/423	neophyte; casual garden escape Central America
105.	<i>Ziziphus jujuba</i> Mill.	<i>Rhamnaceae</i>	2161/243; 2161/441; 2262/111	archaeophyte; casual garden escape; Temporal Asia
