We live in very dangerous time. It is a great threat than we will live in really dark time soon. The beginning of the 21st century did not justify the expectations of the benevolent people of 20th century. Instead of global understanding and mutually helping mankind chose rough competition and individual and national greediness. We still do not understand that

Earth is common responsibility and there are no individual or national future without respect to nature and solidarity between people.

In the figure below are shown projections of surface temperature changes. Source is Forth Assessment Report of the Intergovernmental Panel on Climate Change.

Global warming affecting all living creatures on the Earth. It is mainly the consequence of avidity for unreasonable and wicked wealth of a minority people who are mainly high but unconscionable educated, people who want to rule over others. Their perception of nature is dangerous primitivism. To understand the nature means do not destroying life, do not create suffering and pain to other living creatures.

Intention of president Donald Trump to withdraw United States of America from Paris Climate Agreement signed by 195 nations is a classic example of dangerous primitivism. But it is dangerous primitivism with possible

catastrophic consequences for every inhabitant on Earth. Responsible intellectuals all over the World, especially scientists, can not keep silent!

Disasters which are consequence of climate changes take more and more human and animal lives with increase of material damage. Climate changes are an everyday reality and we need to live with their implications but never accept way of living which caused them.

The holistic approach to environment includes necessity of action. Specially in democratic societies we must speak in the loud voice for reasonable decisions of our leaders.

We are all responsible. *Sumus omnium reus.*
