Studies in the Sphingolipids Series. XVIII.*
Synthesis and Resolution of 1-Hydroxy-2-aminoeicosane
(C20-Sphingine)

M. Munk-Weinert and M. Prostenik

Department of Chemistry, Medical Faculty, University of Zagreb,
Zagreb, Croatia, Yugoslavia

Received October 28, 1960

The preparation of racemic 1-hydroxy-2-aminoeicosane (C20-
sphingine) is described. The racemic base was resolved into the
optical antipodes via the diastereomeric L-glutamates. N-Acetyl-
and O,N-diacetyl derivatives of the enantiomeric bases are de-
scribed. D-Configuration is assigned to the (−) base.

D(−)-C18-Sphingine (1-hydroxy-2-aminooctadecane) is a well known degra-
dation product of C18-sphingosine. The synthesis of both optically active forms
has been described in a paper by Sunko and Prostenik where also the relating
references can be found1. The synthesis of radioactive DL-1-14C-sphingine has
also been reported2.

Most recently, Prostenik and Majhofer-Oreščanin reported the occurrence
of C20-sphingosine (1,3-dihydroxy-2-amino-4-eicosene) in both horse and beef
brain. It has also been shown that the new base could be reduced into C20-
sphingine3. Since one could suppose very similar properties — such as melting
points and, particularly, specific rotations — of C18 and C20-sphingosine, it was
of interest to prepare a simpler molecule of C20-sphingine in order to compare
its properties with those of C18-sphingine. Undoubtedly, this knowledge would
facilitate the improvement of the separation procedures of homologous bases
from natural mixtures.

The starting material was very carefully purified stearic acid. This was
successively converted, in a series of known reactions1, into the following
compounds: stearoyl chloride, 1-diazo-2-nonadecanone, methyl and ethyl nona-
decanoate, nonadecanoic acid, nonadecanoic acid chloride, 1-diazo-2-eicosanone,
1-acetoxy-2-eicosanone, 1-hydroxy-2-eicosanone oxime, and finally 1-hydroxy-
2-aminoeicosane (D1-C20-sphingine). Resolution of the racemic base into the
optical antipodes was effected highly satisfactorily by means of L-glutamic
acid. Both (+) and (−)-base were converted into the nicely crystalline N-acetyl
and N,O-diacetyl derivatives. The melting points and specific rotations of C18
and C20-bases and derivatives are listed in Table I.

On the basis of a striking similarity in optical properties of the two bases
it is tentatively concluded that the (−)-base has the D-configuration.

We wish to point out that the experimental data are described in more detail since many essential improvements in relation to the preparation of the C₁₈-base have been achieved.

EXPERIMENTAL

The melting points reported are uncorrected values. Rotations were measured in chloroform.

1-Diazo-2-nonadecanone

The diazoketone was prepared according to Grundmann⁴ starting with stearoyl chloride (30.5 g.) and diazomethane (from 36 g. of nitrosomethylurea). The yield was 30.7 g. (98.8%) of a product melting at 69—70°.

Ethyl Nonadecanoate

The diazoketone (30.5 g., 0.1 mole, m.p. 69—70°) was suspended in 200 ml. of absolute ethanol and placed in a 1000-ml. three-necked round-bottomed flask fitted with a mechanical stirrer, a dropping funnel and a condenser. A solution of silver benzoate (2 g.) in triethylamine (18 g.) was then added dropwise over a period of 70 min. The reaction mixture turned black and the evolution of nitrogen started immediately. The reaction mixture was then refluxed for 15 min. and filtered by aid of charcoal. The solvent was removed by distillation in vacuo, the residue dissolved in ether (200 ml.) and washed successively with N hydrochloric acid, sodium hydrogen carbonate and water. After drying over sodium sulphate and removal of the solvent the crude ester was purified by distillation. The yield was 25.3 g. (78.4%), b.p. 210—225° at 12 mm. Hg.

Methyl Nonadecanoate

The Wolff rearrangement of the diazoketone was carried out in methanol exactly as described in the foregoing preparation. Thereby, the ester, b.p. 215—225° at 12 mm. Hg., was obtained in a 81.6% yield.

Nonadecanoic Acid

Alkaline hydrolysis of the methyl or ethyl ester in the usual manner furnished pure nonadecanoic acid, m.p. 67—68°, yield 95—98%.

1-Diazo-2-eicosanone

Nonadecanoic acid chloride was prepared by heating the acid (10 g., m.p. 67—68°) with thionyl chloride (15 ml.) at 70° for 1 hr. After removal of the excess of
thionyl chloride in vacuo the procedure was repeated with a new quantity of the reagent. The yield of the acid chloride, b. p. 223° at 14 mm. Hg., was 8.2 g. (77.2/o). It was dissolved in absolute ether and treated in the conventional manner with the ethereal solution of diazomethane (prepared from 13.4 g. of nitrosomethylurea). Evaporation of the solvent to dryness in vacuo yielded 8.1 g. (97/o) of the diazoketone, yellow leaflets, m. p. 69—71°. It was used without further purification for the next reaction step.

1-Acetoxy-2-eicosanone

A sample of 1-diazo-2-eicosanone (8 g., 24.8 mM) was added in small portions to glacial acetic acid (30 ml.) containing potassium acetate (1 g.) at 70°. For the completion of the reaction the solution was refluxed for 1 hr. After cooling to room temperature the reaction mixture was poured into water (150 ml.), the separated solid extracted with ether, the solution washed thoroughly with water and dried over sodium sulphate. The solvent was then distilled off to yield 8 g. (91°/o) of the crystalline solid, m. p. 79—81°. One crystallization from 95°/o ethanol (150 ml.) with addition of charcoal yielded 6.75 of a product melting at 81—82.5°. For analysis the substance was dissolved in benzene and chromatographed through activated aluminium oxide (Fluka). Colourless crystals, m. p. 82—83°.

Anal. 7.520 mg. subst.: 20.55 mg. CO2, 7.97 mg. H2O
C22H42O3 (354.56) calc'd: C 74.52; H 11.94/o
found: C 74.57; H 11.86/o

1-Hydroxy-2-eicosanone oxime

A solution of the acetoxy ketone (4 g. 11.3 mM, m. p. 81—82°) and hydroxylamine acetate (prepared from 10 g. of hydroxylamine hydrochloride and 15 g. of crystalline sodium acetate) in absolute ethanol (150 ml.) was refluxed for 15 hrs. The excess of ethanol was distilled off, water (100 ml.) was added and the mixture extracted with ether. The solution was then washed with water, dried over sodium sulphate and evaporated to dryness. The crude product (3.7 g., 100°/o, m. p. 87—89°) was recrystallized from 1.3 l. of petroleum ether (b. p. 50—70°) (refluxing for at least 1 hr. is necessary). The analytical sample melted at 91—93°.

Anal. 6.815 mg. subst.: 18.20 mg. CO2, 7.44 mg. H2O

found: C 72.88; H 12.22; N 4.44/o

1-Hydroxy-2-amino-20eicosane (DL-C20-Sphingine)

A sample of the oxime (1.6 g., 4.88 mM, m. p. 90—92°) was suspended in absolute ether (50 ml.) and added dropwise to a solution of lithium aluminium hydride (750 mg.) in absolute ether (50 ml.). After the vigorous reaction has subsided the mixture was refluxed for 7 hrs. The excess of hydride was hydrolized by cautious addition of water. The flask content was then evaporated to dryness and the resulting solid extracted with three 50 ml. portions of boiling chloroform. Removal of the solvent in vacuo gave crude amino alcohol, m. p. 80—93°. Recrystallization from petroleum ether (b. p. 60—80°) yielded 750 mg. (49/o) of glistening leaflets, m. p. 86—87°.

Anal. 8.765 mg. subst.: 24.52 mg. CO2, 10.48 mg. H2O

Diacetyl-DL-C20-sphingine

A sample of the base (400 mg., 1.28 mM) was acetylated with an acetic anhydride — pyridine mixture. The crude diacetyl derivative (450 mg., 88.8/o, m. p. 97—99°) was recrystallized from acetonitrile and melted at 97—99°.

Anal. 8.280 mg. subst.: 21.88 mg. CO2, 8.76 mg. H2O
7.355 mg. subst.: 0.219 ml. N2 (21.5°, 750 mm)

N-Acetyl-DL-C_{20}-sphingine

The diacetyl derivative (300 mg.) was hydrolyzed with methanolic potassium hydroxide to give 250 mg. (91.1%) of a product melting at 111—112°. After one crystallization from methanol it melted at 112—113°.

N-Phthaloyl-DL-C_{20}-sphingine

A sample of the base (500 mg., 1.63 mM, m.p. 86—87°), phthalic anhydride (236 mg.) and toluene (50 ml.) were refluxed for 2 hrs. The water formed during the reaction was removed azeotropically. After the completion of the reaction the mixture was evaporated in vacuo to dryness and the crystalline residue (700 mg., 99° i o, m.p. 67—70°) recrystallized from acetonitrile. The analytical sample melted at 72—73°.

N-(o-Carboxybenzoyl)-DL-C_{20}-sphingine

A solution of the N-phthaloyl derivative (150 mg., 0.34 mM, m.p. 72—73°) in 95%/ ethanol (5 ml.) was refluxed with 17%/ ethanolic potassium hydroxide (2.5 ml.) for 10 min. The solution was poured into aqueous hydrochloric acid (1:1, 20 ml.), the crystalline precipitate filtered by suction and washed thoroughly with water. Yield: 150 mg. (96.1%) of colourless crystals, m.p. 105—107°. Further crystallization from methanol gave the analytically pure sample melting at 107—108°.

\end{align*}

Resolution of Racemic C_{20}-Sphingine

D-Glutamic acid (740 mg., 5.03 mM) was dissolved in boiling 50%/ ethanol (85 ml.) and to this solution the racemic base (1.57 g., 5 mM, m.p. 86—87°) in boiling 95%/ ethanol (45 ml.) was added. The solution which became turbid rapidly, was allowed to stand at room temperature for 14 hrs. The crystalline precipitate was collected; yield 1.55 g., m. p. 147—153°. Recrystallization from 90%/ ethanol gave glistening leaflets, 1.15 g., (50%), m. p. 153—155°: glutamate A.

\begin{align*}
\text{Anal.} & \quad \text{7.935 mg. subst.: 0.408 ml. N}_2 \quad (22.5^\circ, 751 \text{ mm}) \\
& \quad \text{C}_{25}\text{H}_{52}\text{N}_2\text{O}_5 \quad (460.68) \quad \text{calc'd: N 6.06}; \\
& \quad \text{found: N 5.85}
\end{align*}

Both mother liquors from the removal and recrystallization of the less soluble glutamate were evaporated to dryness. The residue (1.1 g.) was crystallized from methanol (170 ml.) to yield 660 mg. of a substance melting at 140—155°.
STUDIES IN THE SPHINGOLIPIDS SERIES. XVIII 201

It was recrystallized from methanol, the insoluble free glutamic acid being removed by filtration; m. p. 139—140°: glutamate B.

Anal. 7.210 mg. subst.: 0.394 ml. N\(_2\) (23°, 750 mm)
