Grbac, I., Katušić, L. & Lukić, M.: Catalogue of spiders (Araneae) deposited in the Croatian Natural History Museum. Nat. Croat. Vol. 28, No. 1., 185-269, Zagreb, 2019.

The paper presents information on the spider collection (Araneae) housed in the Natural History Museum in Zagreb, Croatia. The collection was founded in 1931 and now includes the material assembled in 1884–1964; it consists of 2,461 lots and numbers 8,478 specimens belonging to 464 species, mainly collected by the Croatian arachnologist Narcis Damin. Most specimens are well-preserved in ethanol. This spider collection does not cover all Croatian regions with the majority of samples (67%) originating from coastal regions of east Adriatic. A taxonomic re-examination of the collection has revealed 31 species that are new to the Croatian spider fauna. Spider collecting has been resumed in Croatia recently.

Key words: Museum Collection, Narcis Damin, Rikardo Gasperini

Grbac, I., Katušić, L. & Lukić, M.: Katalog Zbirke pauka (Araneae) u Hrvatskom prirodoslovnom muzeju. Nat. Croat. Vol. 28, No. 1., 185-269, Zagreb, 2019.

Rad donosi podatke o Zbirci pauka (Araneae) pohranjenoj u Hrvatskom prirodoslovnom muzeju u Zagrebu. Zbirka je osnovana 1931. godine i danas obuhvaća materijal prikupljan u razdoblju 1884.–1964.; sastoji se od 2.461 inventarne jedinice te broji 8.478 primjeraka 464 vrste, koje je uglavnom prikupio hrvatski arahnolog Narcis Damin. Većina primjeraka je dobro očuvana u etanolu. Zbirka pauka ne pokriva sve hrvatske regije; većina uzoraka (67%) potječe s istočne obale Jadrana. Taksonomska revizija zbirke utvrdila je 31 vrstu novu za hrvatsku faunu pauka. Odnedavno je prikupljanje pauka u Hrvatskoj ponovno započelo.

Ključne riječi: muzejska zbirka, Narcis Damin, Rikardo Gasperini

INTRODUCTION

In the last two hundred years scientific collections form the core of biological research, particularly in taxonomy and systematics. Natural history collections had a crucial role in scientific thoughts of Charles Darwin and Alfred Russell Wallace. Without natural history collections, knowledge on the Earth's biodiversity and benefits that could derive from it would have been lost (SUAREZ & TSUTSUI, 2004). The Croatian Natural History Museum (CNHM) in Zagreb holds the only museum spider collection in Croatia.

The requirement of the sustainability of collection can be satisfied if the collection has a legal status and consequently an institution that has been formally tasked with its preservation and meets the technical requirements of storage, regular maintenance and a developed system of information on the deposited materials. The collection value is increased, if a scientific analysis based on collection material and a systematic and planned gathering of specimens are undertaken (KOVAČIĆ, 2006; WINKER, 2004). Housed and documented specimens create a scientific potential by ensuring their availability to other researchers (McLEAN *et al.*, 2016), but the deposition of studied specimens in natural history museums is not a consistent legal requirement yet. Storing collections in museum ensures long-term professional care and continuous public funding financial support for collection maintenance. Preserved specimens and samples of tissues retain a scientific potential for future research applying new technologies such as molecular analysis (McLEAN *et al.*, 2016). Specimens housed in natural history museums would provide many answers to future questions, but assembling collections require the joint endeavours of curators, scientific community and funding institutions (McLEAN *et al.*, 2016).

The principal goals of this paper are (1) to present information on and evaluation of the spider collection deposited in the CNHM, and (2) to encourage scientific debates and discussion of future directions in the development of this collection.

MATERIAL AND METHODS

The nomenclature used in this catalogue follows World Spider Catalog (WSC, 2018). Within each family, the genera and species are arranged alphabetically.

Each entry presents an inventory number (lot) and includes:

- the taxonomic status according to WSC (2018);
- the original taxon name, as given in the ID label;
- specimen numbers (Spec. No.) with reference to sexual maturity: F – adult female, M – adult male, SUBF – subadult female, SUBM – subadult male, JUV – juvenile;
- information transcribed from the original data label: leg. = legit (collected by), loc. = locality, date = collection date. If the original locality is poorly known, additional information is given. Abbreviations of overseas localities are indicated in concordance with ISO 3166-1 South America (SA*), AT (Austria), BA (Bosnia and Herzegovina), ME (Monte Negro), IN (India), HU (Hungary), PL (Poland), RO (Romania), SK (Slovakia), SI (Slovenia), RS (Serbia), UA (Ukraine);
- * continental code.

Abbreviations:

* - new species to the Croatian fauna.

*? - dubious records.

** - species represented by damaged specimen, thus their re-identification was not possible. Such species names are listed in their current taxonomic interpretation based on the original identification; if a re-examination did not confirm the species name given originally, such samples are listed under generic names only.

*** - species represented only with juvenile specimens, thus redetermination was possible only to the genus level. The stated species name is current taxonomic interpretation of the original species name.

- quotations the Museum's Spider Catalogue without specimen.

When more than one species was found in a sample, a new inventory number was assigned and specimen(s) were stored in a separate tube. We have added 25 obviously historical inventory notes which had no voucher specimens, thus without assigning a new inventory number to them (#).

Dried specimens were re-hydrated. The conventional method (JOCQUE, 2008; BACCALONI, 2012) involves treating dried specimen with trisodium phosphate (Na_3PO_4) and re-conservation then in a sufficient amount of ethanol. Trisodium phosphate softens the inner tissues and restores them to the original form. Dried specimens were dipped into a 0.5% solution of Na_3PO_4 until they sank, which was the sign of successful rehydration. After washing in distilled water, specimens were soaked in gradually increasing concentrations of alcohol (20% and 40% ethanol solution). Finally, spiders were preserved in 70% ethanol in cleaned original glass jars. The permeability of the original ground glass stoppers has been reduced with a layer of beeswax.

RESULTS & DISCUSSION

Historical background

The collection was founded in 1931 by the former curator Nikola Fink, who processed the housed material and compiled the Spider Catalogue (ČANADIJA, 1974) containing 2,242 samples. The first 130 specimens came from the collection by Rikardo Gasperini (1853–1939) (ČANADIJA, 1974; ČANADIJA & PAVLETIĆ, 1976; CNHM archive). The Spider Collection of Narcis Damin (1845–1905) arrived to CHNM in 1906 (CNHM archive, annual report 1907). The Damin collection

Fig. 1. Specimens in the Spider Collection preserved in ethanol (Photo N. Borčić).

Fig. 2. A page from drawing collection by N. Damin.

contained specimens from two suborders, 21 families, 120 genera and 545 (sub) species and varieties housed in glass jars (Fig. 1), but the original specimen number remains unknown. Damin's accompanying drawing collection (Fig. 2) was donated to the museum in 1916 (CNHM archives, annual report 1917). Although the first written data on spiders in Croatia date back to 1774 (FORTIS 1774), first Croatian arachnologists appeared in the late 19th century when the first papers on Croatian spiders were published by Adolf JURINAC (1886, 1887) and Rikardo GASPERINI (1891, 1892). The first Croatian arachnologist was Narcis Damin, who focused mostly on spiders of the northern part of East Adriatic. However, many other Croatian entomologists donated him samples from all over Croatia, and soon Damin gathered an extensive collection of spiders (KATUŠIĆ & DRAKŠIĆ, 2011). In 1900, based on his own collection and literature data, Damin published the first comprehensive inventory of Croatian spiders which listed 556 species (DAMIN, 1900).

Reconservation and revision

The Museum's Catalogue of 1931 contains 2,242 inventory numbers. A revision and re-identification of the material have revealed 8,478 specimens in 2,461 lots, each with an individual inventory number. The Museum's spider collection holds 464 species, 200 genera and 38 families (Tab. 1). Of them, 349 species were collected from 203 different localities in Croatia (Fig. 3, Appendix 1). The remaining 74 species were sampled from 36 overseas localities (Fig. 4). The names of 35 localities were impossible to confirm.

Specimens in the spider collection are preserved in ethanol and housed in glass jars. Most of them are well-preserved, but in a few cases alcohol evaporated and

specimens dried out. Such specimens have been re-hydrated. The entire spider collection has been digitized, re-conserved and restored (if needed), and all the specimens have been re-examined and re-identified by L. Katušić.

Collectors and date range

The oldest sample in the spider collection is *Simitiodion simile* collected by Damin in 1884. The latest sample was collected in 1964, since then spiders had not been collected and/or deposited in the museum until the collecting activity was resumed in 2017. The newly collected materials are not included in the present work.

Analysis of data from labels and catalogue revealed that among 2,461 lots (=inventory numbers), 43% (N=1,069) have a valid collecting year and other 57% (N=1,392) contain incomplete data sets, with an unknown year. The most productive seasons were 1890/91, due to activity of N. Damin, followed by the period 1897–99 when he and A. Langhoffer were actively collecting, and by 1902

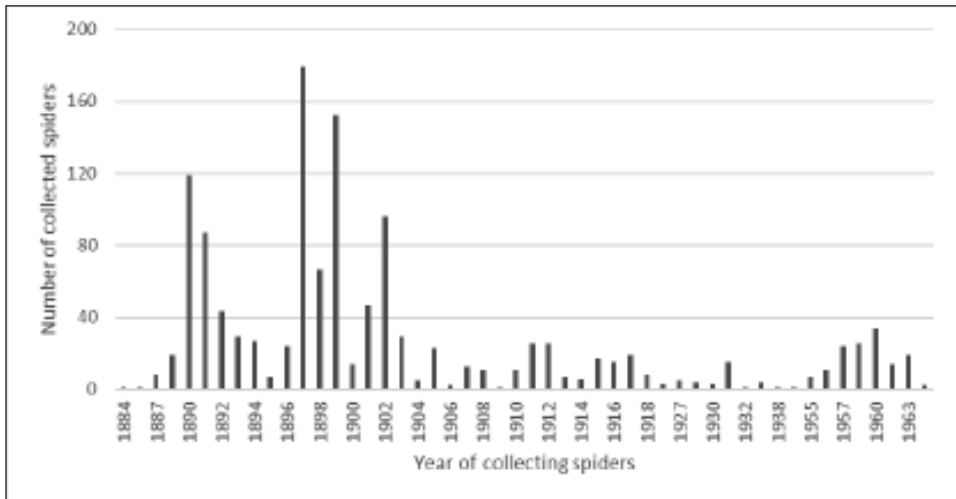

Fig. 5. Number of collected spider specimens at different years.

when various collectors contributed (Fig. 5). Katušić and Drakšić in their historic review of arachnology in Croatia (KATUŠIĆ & DRAKŠIĆ, 2011) marked the end of 19th century as the most productive period, corresponding with the highest number of samples accumulated in the collection.

With regards to contribution of various collectors, only 39% (950) of data contain a collector name, while collectors of 59 samples (N=1,511) are unknown. Among 35 collectors, N. Damin expectedly contributed the largest sample number – 664. R. Gasperini collected 92 and A. Langhoffer 71 samples, respectively. A. Langhoffer was the second director of the former Zoological Museum, but the majority of his samples were collected before that period. R. Gasperini was the first author who published a list of 195 spider species occurring in Dalmatia (coastal part of Croatia) (GASPERINI, 1891, 1892). N. Damin was considered the

most notable arachnologist in Croatia (KATUŠIĆ & DRAKŠIĆ 2011). He published an extensive list of 556 spider species occurring in Croatia (DAMIN, 1900), collected and housed vouchers in his spider collection which then formed a significant part of the spider collection at CNHM.

Geographical distribution

With regards to geographic information, 1,803 samples originated from Croatia, 223 from abroad and 436 samples are without any locality data (Appendix 1, Figs 3 and 4). It is worth noticing that the spider collection was not sampled in order to cover all Croatian regions, but was rather assembled as a result of random sampling and occasional donations. Analysis of the geographic distribution of spiders collected from Croatia shows that majority of them originated from the Mediterranean (67%, N=1,201), 21% (N=383) from the mainland and only 12% (N=219) from the Alpine biogeographical region. More than a half of the Mediterranean samples (64%) were collected from the northern Croatian coast (including Krk island) with the town of Bakar as a single locality with the largest number of samples (N=322). It is hardly surprising, as N. Damin worked at the Naval school in Bakar. On the other hand, Istra (the northern Croatian coast) is presented with fewer samples, of which 249 originated from the southern Croatian coast (Dalmatia) and islands. Samples from the continental region were mostly taken from two big cities, Osijek (N=120) and Zagreb (N=112). The CNHM is situated in Zagreb, and the material from Osijek was presumably collected by A. Langhoffer who worked there. The Alpine region is represented with the least sample number. The greatest part was originated from Gorski kotar county, the highland region in the north-western part of Alpine Croatia, whereas the smallest number originated from Plitvice (Lika region).

Based on the present findings, the spider collection at hand can be considered as historical (the last spider was collected in 1964), with a scattered geographical distribution of samples. Regions that are well-represented are Sjeverno Hrvatsko primorje (North Croatian littoral), Gorski kotar (Alpine region) and the cities of Zagreb and Osijek. However, large parts of Croatia, such as Istra, Adriatic islands, central and southern Dalmatia in the Mediterranean, and the extended region of Dinaric carst, remain almost completely unexplored. The continental region of Croatia was also poorly sampled, except for Zagreb and its vicinity, and Osijek.

Rare and interesting species

Besides numerous taxonomically interesting records, the spider collection housed in CNHM contains 31 spider species that are new to the Croatian fauna (Appendix 2). The majority of them are widespread in Europe and their presence in Croatia was expected. In some cases, distribution ranges of some species are broadened. For instance, *Micaria pallipes*, *Thanatus coloradensis* and *Xysticus gallicus* are first recorded from Croatia, with published records for the Western Balkans only. The record of *M. pallipes* from the northern Adriatic shows the gap in the species' Mediterranean distribution. The range of Palaearctic *T. coloradensis* is broadened toward the eastern Adriatic. *X. tenebrosus* is a thomisid species distributed in the Eastern Mediterranean (WSC, 2018), and Croatia can be

considered as an expected territory of its occurring. *Textrix chyzeri* from the northern Adriatic extends its somehow scattered distribution range toward the seaside and further to the west. The troglophile *Dysderocrates storkani* (MAMMOLA *et al.*, 2017) also recorded from the northern Adriatic extended its range, which includes the SE Balkans, towards the west and possibly to lower altitudes towards the sea. Its data label says *above Senj* (seaside town), without an altitude specification. Two juvenile specimens identified as *Clubiona decora* could not be confirmed. This species is limited to Madeira, Porto Santo and Azores (BOSMANS *et al.* 2017b), and those records are probably misidentification. An article describing in detail the importance of spider collection with thorough comments on all taxonomically and faunistically interesting records, including remarks on a possibly new *Berinda* species, is in preparation by L. Katušić with co-authors.

In the last decade new interest in the arachnology has evolved in the Croatian scientific community. The present catalogue of the spider collection at CNHM represents the first step and baseline for future research. We encourage future researchers whose projects include collecting wild organisms to consider depositing their voucher specimens in the Museum of Natural History Collections in Zagreb. Spider collecting at CNHM was resumed in 2017, and hopefully will result in a better collection access.

ACKNOWLEDGEMENT

We would like to thank all the colleague-arachnologists (Jerzy Prószyński, Petr Dolejš, Yuri Marusik, Tanya Tuneva, Peter van Helsdingen, Milan Režac, Mykola Kovblyuk, Fulvio Gasparo, Arthur Decae, Angelo Bolzern and many others) who provided us with invaluable help with species identification and the literature needed. For their frequently needed "second opinion" we are also in debt to members of the Croatian Arachnological Society "Narcis Damin".

We thank Darija Čaleta and Marina Višić Vranjković for their help in documentation and literature survey. We also wish to thank Marijana Vuković for her kind help in proofreading of the ms and Mladen Kučinić for clarifying the ideas discussed in it.

Finally, the authors thank two reviewers for their helpful feedback on an earlier draft.

Received November 28, 2017

Appendix 1. List of collecting localities of spiders from the CHNM Collection.

Number	State	Locality	X	Y
1	Croatia	Vrgorac	17,37218	43,20564
2	Croatia	Badinec	16,55952	45,8172
3	Croatia	Dalmacija		
4	Croatia	Novigrad, Dalmacija	15,54885	44,18132
5	Croatia	Sveti Filip i Jakov, Dalmacija	15,42846	43,96216
6	Croatia	Vrana, Dalmacija	15,5673	43,9485
7	Croatia	špilja Pečina kod Vrane, Vrana, Dalmacija	15,55492	43,9599
8	Croatia	Muč, Dalmatinska zagora	16,47607	43,69165
9	Croatia	Dugi otok, luka Tajer	15,20545	43,85303
10	Croatia	Đurđevački pijesci	17,09927	46,02851
11	Croatia	Lokve, Gorski kotar	14,75087	45,35831
12	Croatia	Mrzla Vodica, Lokve, Gorski kotar	14,66558	45,36986
13	Croatia	Zapeč, špilja Zapeč, Gorski kotar	15,08004	45,48199
14	Croatia	Vrata, Gorski kotar	14,73011	45,31814
15	Croatia	Plešće, Gorski kotar	14,68631	45,54669
16	Croatia	Bakar	14,53425	45,30675
17	Croatia	Bakar, brdo Kalvarija	14,53175	45,30564
18	Croatia	Bakar, iznad kupališta	14,56709	45,29248
19	Croatia	Sveti Kuzam, Bakar	14,52205	45,31459
20	Croatia	Bakar, obala	14,54345	45,29795
21	Croatia	Bakar, područje Turčina	14,53314	45,31043
22	Croatia	Bakar, predio Mandrač	14,54283	45,29947
23	Croatia	Biograd na Moru, okolica	15,44383	43,93721
24	Croatia	Cavtat	18,2177	42,58116
25	Croatia	Crikvenica	14,69124	45,17347
26	Croatia	Draga Crikvenička, Crikvenica	14,71715	45,17252
27	Croatia	Selce, Crikvenica	14,71976	45,15753
28	Croatia	Delnice	14,80163	45,39879
29	Croatia	Dubrovnik	18,09442	42,65063
30	Croatia	Đakovo	18,40979	45,30994
31	Croatia	Đurđevac	17,07144	46,03977
32	Croatia	Fužine	14,71482	45,30494
33	Croatia	Garešnica	16,94076	45,57417
34	Croatia	Hrvatska Kostajnica, područje Palanka	16,53961	45,22798
35	Croatia	Hrvatska Kostajnica, rukavac Unčica	16,54947	45,22031
36	Croatia	Karlobag	15,07288	44,52842
37	Croatia	Klanjec	15,7445	46,0506
38	Croatia	Kraljevica	14,57176	45,27462
39	Croatia	Krapina	15,8724	46,16043

Number	State	Locality	X	Y
40	Croatia	Križevci	16,54628	46,02229
41	Croatia	grad Lovran	14,27236	45,29688
42	Croatia	Malinska	14,5288	45,12501
43	Croatia	Novi Vinodolski	14,78976	45,12844
44	Croatia	Novi Vinodolski, izvor Ivanj	14,78644	45,14535
45	Croatia	Ogulin	15,22387	45,26582
46	Croatia	Ogulin, područje Bukovnik	15,21697	45,2544
47	Croatia	grad Omiš	16,6929	43,44329
48	Croatia	Bregi, Opatija	14,29882	45,3491
49	Croatia	Osijek	18,69552	45,55487
50	Croatia	Otočac	15,23752	44,86888
51	Croatia	Ozalj, Ozaljska špilja	15,46563	45,61562
52	Croatia	Požega	17,67447	45,33145
53	Croatia	Rijeka	14,4422	45,32701
54	Croatia	Rijeka, Orehovica, područje Žakalj	14,46491	45,33894
55	Croatia	Rijeka, Ratulje	14,44562	45,38505
56	Croatia	Rijeka, Sušak	14,47194	45,32402
57	Croatia	Rijeka, Trsat	14,46656	45,33334

Appendix 2.

Spider species in the CNHM Collection of Spiders considered as new species in Croatian fauna, including species whose identity could not be confirmed, in alphabetical order.

Abbreviations:

* - new species to the Croatian fauna.

*? - dubious records.

** - species represented by damaged specimen, thus their re-identification was not possible. Such species names are listed in their current taxonomic interpretation based on the original identification; if a re-examination did not confirm the species name given originally, such samples are listed under generic names only.

*** - Species represented only with juvenile specimens, thus redetermination was possible only to the genus level. The stated species name is current taxonomic interpretation of the original species name.

- quotations the Museum's Spider Catalogue without specimen.

Family AGELENIDAE

Tegenaria ferruginea (Panzer, 1804)*

Tetrax chyzeri de Blauwe, 1980*

Family AMAUROBIIDAE

Amaurobius jugorum L. Koch, 1868*

Family ARANEIDAE

Araniella inconspicua (Simon, 1874) ****

Zygiella atrica (C. L. Koch, 1845)*

Family CLUBIONIDAE

(*Clubiona decora* Blackwall, 1859 ****)

Clubiona frutetorum L. Koch, 1867 **

Dysderocrates storkani (Kratohvil, 1935)*

Family EUTICHURIDAE

Cheiracanthium elegans Thorell, 1875 ****

Cheiracanthium punctorium (Villers, 1789)*

Family GNAPHOSIDAE

Berinda sp. nov.*? (Katušić in prep.)

Micaria pallipes (Lucas, 1846)*

Family LINYPHIIDAE

Micrargus herbigradus (Blackwall, 1854)*

Nerienne peltata (Wider, 1834)*

Silometopus reussi (Thorell, 1871)*

Stemonyphantes lineatus (Linnaeus, 1758) ****

Family LIOCRANIDAE

Walckenaeria antica (Wider, 1834) **

Family LYCOSIDAE

Alopecosa farinosa (Herman, 1879)*

Alopecosa sulzeri (Pavesi, 1873)*

Alopecosa taeniata (C. L. Koch, 1835)*

Pardosa alacris (C. L. Koch, 1833)*

Trochosa terricola Thorell, 1856*

Family PHILODROMIDAE

Philodromus marmoratus Kulczyński, 1891 ****

Thanatus coloradensis Keyserling, 1880*

Family SALTICIDAE

Dendryphantès rudis (Sundevall, 1833) ****

Mendoza canestrinii (Ninni, 1868) ****

Neon reticulatus (Blackwall, 1853) **

Sitticus pubescens (Fabricius, 1775)*

Family TETRAGNATHIDAE

Tetragnatha montana Simon, 1874*

Tetragnatha nigrita Lendl, 1886*

Family THERIDIIDAE

Parasteatoda simulans (Thorell, 1875)*

Phylloneta sisypchia (Clerck, 1757)*

Robertus arundineti (O. P.-Cambridge, 1871)*

Theridion mystaceum L. Koch, 1870*

Family THOMISIDAE

Synema cf. *ornatum* (Thorell, 1875) sensu (Utochkin A. S., 1960)*?

Xysticus bifasciatus C. L. Koch, 1837*

Xysticus erraticus (Blackwall, 1834)*

Xysticus gallicus Simon, 1875*

Xysticus tenebrosus Silhavy, 1944*

Family ZODARIIDAE

Zodarion germanicum (C. L. Koch, 1837) ****
