
New modalities in the treatment of musculo-skeletal disorders

Ralf Muehlhaeuser

Coming from electro- and ultrasound therapy, going into direction of using radial shockwave and high-power laser in sports medicine and regular treatments.

In the everyday work in rehabilitation clinics in Germany and western Europe we are facing more and more muscle-tendon problems besides the regular back pain or traumatologic disorders with or without surgery; acute, sub-acute or chronic stages and of course due to the growing older population, arthritic changes of cartilage or bone tissue.

Technologies like laser or shockwave can help accelerate the remodeling of tissue and the reduction of pain, while at the same time reducing the impact on the PTs and improve the overall outcome.
