Numismatic findings from the Cathedral of St. Jacob, Krbava

Abstract

The author of this paper brings an overview of the money found during the archaeological researches of the cathedral in Krbava between 2000 and 2019. A part of the money comes from the graves, among which are especially distinguished 25 silver coins from the grave 123, *terminus post quem* of 1382. The coins provide an evidence of continuous usage of one's position from the end of the 13th until the end of the 15th century. Among the founded coins from that time, the most frequent findings are those from Venice. The coin that is the newest one, after more than three centuries without any kind of numismatic findings, brings an evidence of the graveyard built in this area in the first half of the 19th century.

Key words: Udbina, Krbava, numismatic findings
