Milović, M., Pandža, M., Jasprica, N., Tafra, D. & Krpina, V.: The vascular flora of Mt Svilaja (Outer Dinarides, South Croatia). *Nat. Croat.*, Vol. 30, No. 1, 85–144, 2021, Zagreb.

Based on our own research carried out from 2013 to 2019 and literature data, this study presents for the first time a comprehensive floristic list of Mt Svilaja (max. 1508 m a.s.l.). It contains 1285 taxa classified within 502 genera and 109 families. Of these, 552 taxa are listed for the first time for Svilaja. Out of 733 taxa recorded previously, the presence of 128 taxa has not been confirmed. *Poaceae* (8.79%), *Asteraceae* and *Fabaceae* (8.72% each) had the highest number of taxa, with the largest number of taxa within the genera *Trifolium* (23 taxa), *Carex* (20) and *Centaurea* (17). Hemicryptophytes (43.35%) and therophytes (25.45%) prevailed, and Mediterranean (23.27%), southern European (20.83%) and Eurasian (17.43%) plant taxa dominated. Altogether, there were 76 endemics (5.91%), mostly of Illyrian-Adriatic origin, 34 endangered (CR, EN, VU) taxa (2.65%), and 155 strictly protected taxa according to Croatian law (12.06%). Among the endemics, the presence of *Scabiosa delminiana* Abadžić must be stressed. Mt Svilaja is characterized by rich orchid flora (51 taxa, 3.97%), and features *Epipactis palcentina* Bongiorni & Grünanger, the only site found in Croatia that does. Although as many as 34 invasive taxa have been recorded, their presence is mostly limited to anthropogenic habitats.

**Keywords:** Adriatic-Dinaric carbonate platform, biodiversity, chorology, conservation, Dinaric Karst, floristic investigation

Milović, M., Pandža, M., Jasprica, N., Tafra, D. & Krpina, V.: Vaskularna flora planine Svilaje (vanjski Dinaridi, južna Hrvatska). *Nat. Croat.*, Vol. 30, No. 1, 85–144, 2021, Zagreb.

Na temelju vlastitih istraživanja (2013.–2019.) i literaturnih podataka, u radu je po prvi put prikazan cjeloviti popis vaskularne flore planine Svilaje (1508 m n.v.). Utvrđeno je 1285 svojti, svrstanih u 502 roda i 109 porodica. Od toga su 552 svojte nove za Svilaju, a od 733 svojte prethodno zabilježene u literaturi za njih 128 nalazi nisu potvrđeni. Porodice s najvećim brojem svojti su *Poaceae* (8,79%) te *Asteraceae* i *Fabaceae* (obje po 8,72%), a svojama najbogatijim rodovima su *Trifolium* (23), *Carex* (20) i *Centaurea* (17). Među životnim oblicima prevladavaju hemikriptofiti (43,35%) i terofiti (25,45%), a među geoelementima najveći je udio mediteranskih (23,27%), južnoeuropskih (20,83%) i euroazijskih biljaka (17,43%). Udio biljaka od posebnog značaja bio je sljedeći: 76 je endema (5,91%), najviše iz skupine Ilirsко-jadranskih, 34 ugroženih (CR, EN, VU; 2,65%) i 155 strogo zaštićenih (12,06%) svojti u Hrvatskoj. Među endemima, poglavito ističemo prisutnost vrste *Scabiosa delminiana* Abadžić, što je drugi nalaz u Hrvatskoj. Svilaja je iznimno bogata orhidejama (51 svojta, 3,97%) među kojima je i *Epipactis palcentina* Bongiorni & Grünanger čije je nalazište na Svilaji jedino u Hrvatskoj. Ukupno su tu 34 invazivne svojte, a njihovo rasprostranjenje ograničeno je na antropogenu staništa.

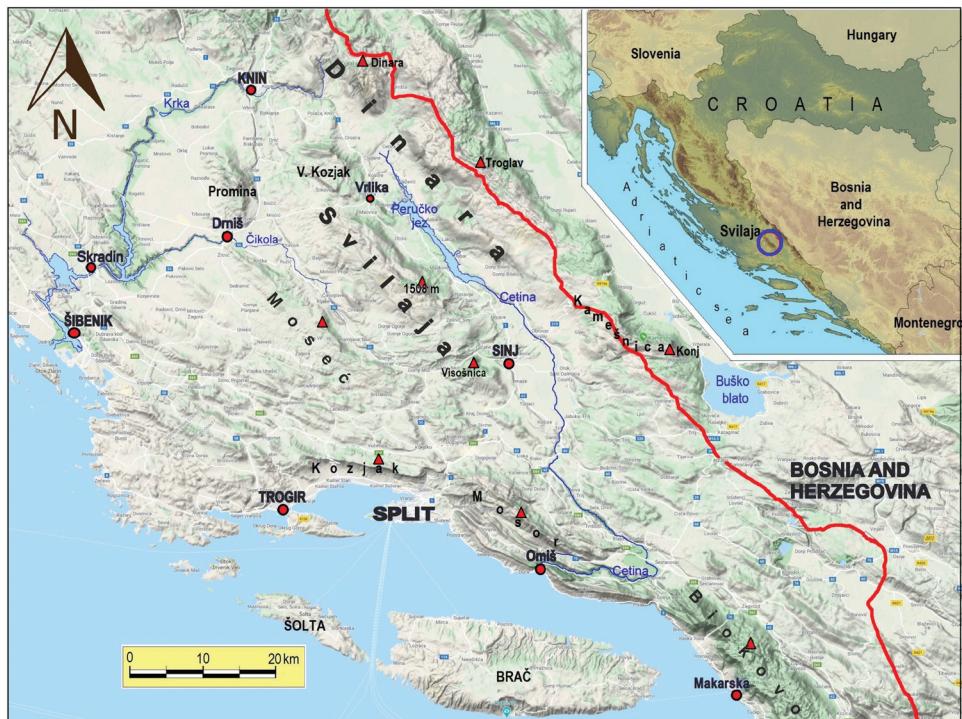

**Ključne riječi:** biološka raznolikost, dinarski krš, floristička istraživanja, Jadransko-dinarska karbonatna platforma, korologija, zaštita i očuvanje

## INTRODUCTION

Svilaja (1508 m a.s.l.) is a mountain located in the central part of the Outer Dinarides in the basement of the Adriatic-Dinaric carbonate platform. Together with the mountains Promina (1147 m), Veliki Kozjak (1206 m), and Moseć (838 m), Mt Svilaja belongs to the central group of Dalmatian mountains located between the higher mountain range of Dinara (1810 m a.s.l.), Troglav (1912 m), and Kamešnica (1855 m), located alongside the borderline of Bosnia and Herzegovina on the one side, and the Adriatic coastal mountains Kozjak (779 m), Mosor (1339 m), and Biokovo (1762 m) on the other (Fig. 1). Due to the karstic relief, the influence of the Mediterranean climate and the high altitude range, the Dalmatian mountains are characterized by a specific flora and vegetation, which is why they have previously been the subject of botanical studies. The floras of the mountains of Biokovo (KUŠAN, 1969; RADIĆ, 1976; ŠILIĆ & ŠOLIĆ, 2002), Mosor (VLADOVIĆ, 1994), Kozjak (KAMENJARIN, 1996), and Matokit (VITASOVIĆ-KOSIĆ *et al.*, 2020) are well known, while other Dalmatian mountains and hills (Promina, Veliki Kozjak, Svilaja, Moseć, Omiška Dinara, etc.) have not yet been investigated in detail (MILOVIĆ *et al.*, 2020).

The first data on the flora of Mt Svilaja can be found in classical works from the 19<sup>th</sup> century (PETTER, 1832; VISIANI 1842–1852, 1872). At the beginning of the 20<sup>th</sup> century, the Austrian botanist JANCHEN (1908, 1910) reported about 30 plant species from Svilaja. Since the 1960s, however, botanists have only occasionally and incidentally visited Svilaja and published partial floristic records (JEDLOVSKI, 1952; MARKOVIĆ,

**Fig. 1.** Geographical position of the Mt Svilaja in the Dalmatia hinterland (Dalmatinska Zagora), South Croatia.

1964, 1992; MARKOVIĆ-GOSPODARIĆ, 1965; LOVRIĆ *et al.*, 1987, 1989; LOVRIĆ & RAG, 1989; TRINAJSTIĆ, 1992; KRAJČEVIĆ, 2005; DELFORGE, 2006a; MILOVIĆ *et al.*, 2013; MILOVIĆ & KARAĐOLE, 2016; KRAJČEVIĆ & ŠEŠOK, 2016; ŠEGOTA, 2016; ŠEGOTA *et al.*, 2016; VLADOVIĆ *et al.*, 2012, 2019). A historical overview of research into the flora and vegetation of Mt Svilaja is presented in detail by MILOVIĆ *et al.* (2020).

Strong depopulation, frequent wildfires, reduction of the intensity of traditional animal husbandry and agriculture have significantly affected the current state of flora and vegetation (DURBEŠIĆ & FUERST-BJELIŠ, 2016). These changes when combined with historical data indicate the need for comprehensive research into the flora of Svilaja.

The aim of our study research is to finalise an updated comprehensive inventory of vascular flora on Mt Svilaja by tracking current and past records. The present study also includes floristic analysis, and takes into consideration life form spectrum and types of geolements, the contribution of endemic, endangered, protected and invasive taxa. The results of the research will be an important contribution to the knowledge of the recent state of the vascular plant flora of Mt Svilaja and, at the same time, the chorology of plant species in Croatia.

## STUDY AREA

Svilaja is a mountain in the Dalmatia hinterland (Dalmatinska Zagora) located between the towns of Vrlika and Sinj, and extends from northwest to southeast. On the west and south it is separated from the surrounding mountains and hills by karstic fields (Vrličko Polje, Sirjsko Polje, Mućko Polje and Petrovo Polje) with the altitude varying from 300 to 400 m a.s.l. It is bordered by the upper course of the Čikola River and the torrent streams Vrba, Sutina and Karakašica on the west and south, and by the Cetina River with Lake Peruća on the east.

The highest peak of Mt Svilaja (Svilaja Bat or Svilaja, 1508 m a.s.l.) rises from the north of Sinj, approximately 30 km from the Adriatic coast. In the northwestern part (between Vrlika and Knin) Svilaja crosses into the ridge of Veliki Kozjak, separated by a road between the towns of Drniš – Vrlika and Lemeš Pass (860 m a.s.l.). The road between the villages of Muć and Lučane separates the southern slopes of Svilaja from Visošnica (941 m a.s.l.). The length of Svilaja (not including Veliki Kozjak and Visošnica) is approximately 30 km, and the average width is 15 km. The southwestern slopes descend in a slightly terraced manner towards Petrovo Polje, while the southeastern slopes from the highest ridges (Svilaja – Jančag) fall steeply towards the Cetina River and Lake Peruća.

The geological bedrock consists of carbonate rocks, the most common being limestones and dolomites of predominantly Jurassic and Triassic age (BOJANIĆ, 1961; PAPEŠ *et al.*, 1982). In the vicinity of the village of Maovice there are more dilapidated limestone breccias, and the dolomites are more present on the southern slopes of Svilaja towards Muć and Sinj. Silicate terrains in the form of metamorphic rocks (Werfen shales) also occur on Svilaja, for example in the vicinity of Muć, while eruptive rocks have been identified in the vicinity of Vrlika and Sinj (BARIĆ, 1957).

Among the soils, brown soils on limestone (Calcocambisol) predominate on Svilaja, while black soil on limestone (Calcomelanisol), shallow and medium-deep red soils, rendzina on dolomite and dolomitized limestone are much less represented (VUKADINović, 2019). These soils are unsuitable or limitedly suitable for growing plants due to their small depth, excessive water permeability, poor sorption ability

(due to textural, structural and chemical properties) and susceptibility to erosion (BOGUNOVIĆ *et al.*, 2006). Soils are exposed to strong erosion, especially on the southern slopes of Svilaja (the villages of the Ogorje and Muč) where efforts are made to mitigate this process by regulating watercourses and afforestation with black pine (DURBEŠIĆ & MILKOVIĆ, 2005; ČOVIĆ 2017).

The relief of the wider area of Mt Svilaja is characterized by the specific underground water circulation, while most of the surface flows are temporary and torrential, and include the upper course of the Čikola River with its tributaries Vrba, Sutina, Karakašica and Vrlika. Therefore, rare springs, wells, temporary and permanent ponds are of great importance for the human population and livestock on the Mt Svilaja. Surface run-off water quickly infiltrates the soil and flows through the underground network of watercourses. The Mt Svilaja range is the watershed of two river basins – of the Krka and Cetina rivers (BRKIĆ *et al.*, 2006).

According to Köppen's climate classification (KÖPPEN & GEIGER, 1954; STRÄBSER, 1998), the wider area of Mt Svilaja has a moderately warm humid climate with hot summers or a Cfsa type of climate, and in the area of peak ridges a Cfsb type of climate, moderately warm and humid with warm summers (ŠEGOTA & FILIPČIĆ, 2003: 35). The mean annual air temperature is 13 °C, the coldest month is January (3.8 °C), and the warmest is July (23.4 °C; data from the meteorological station in Sinj for the period 1989–2018, Croatian Meteorological and Hydrological Service). The mean annual precipitation is 1147 mm, the lowest in July (45.8 mm) and the highest in November (170.2 mm).

Phytogeographically, Mt Svilaja belongs to the Illyrian sector of the Apennine-Balkan province of the Euro-Siberian region (RIVAS-MARTÍNEZ *et al.*, 1982, 2004). Deciduous vegetation is present in the lower altitudes and belongs to the thermophilic deciduous oak forests of the vegetation class *Quercetea pubescens* Doing-Kraft ex Scamoni et Passarge 1959, while in the higher belts mesophilic deciduous and mixed forests of the class *Carpino-Fagetea sylvaticae* Jakucs ex Passarge 1968 (MUCINA *et al.*, 2016; ŠKVORC *et al.*, 2017) occur. Unlike some of the coastal Dalmatian mountains (Kozjak, Mosor and Biokovo), due to the long distance from the Adriatic Sea, Mt Svilaja doesn't include a belt of Mediterranean evergreen holm oak forests (KUŠAN, 1969: 104).

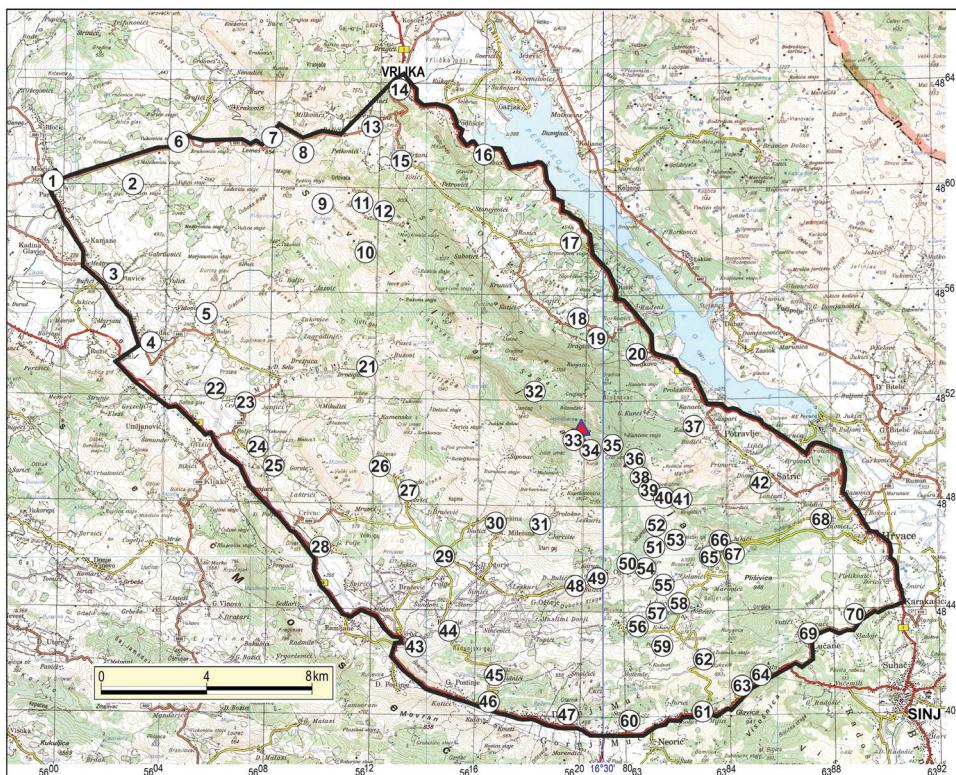

Along with natural factors, human activity has had a long-lasting and significant influence on the current state and features of the vegetation on Svilaja. In the 19<sup>th</sup> and in the first half of the 20<sup>th</sup> century, the area under forests was significantly reduced (i.e., cleared) to provide space for pastures and arable land (DURBEŠIĆ & FUERST-BJELIŠ, 2016). In the last 50 years there has been a reverse trend due to the effects of emigration and the related reduction of areas used for grazing. In some areas there are abandoned arable fields and pastures overgrown with thickets and forests. Surface areas with thickets and forests would have been significantly larger if there had not been frequent wildfires during the last 20 years the extinguishing of which was difficult or impossible due to the inaccessible terrain and mines left after the Homeland War (DURBEŠIĆ & FUERST-BJELIŠ, 2016). More recently, the construction of wind turbines on Svilaja has been intensified, which further disturbs the natural landscape and devastates the vegetation. Wind turbines have been built in the area of the village of Ogorje (Kokani), and new ones are planned to be built near the village of Zelovo and on the hills of Visošnica and Visoka, etc. (MESARIĆ, 2016).

A more detailed overview of the natural features of Mt Svilaja is presented in the paper given by MILOVIĆ *et al.* (2020).

## MATERIALS AND METHODS

This study covered the investigated area on Mt Svilaja within the boundaries shown in Fig. 2. The northern border was the road between Drniš and Vrlika, from the settlements Miočić to Vrlika, including the settlements Maovice and Vrlika. The eastern border was the road from Vrlika – Sinj to Karakašica. The south-western border lies on the road between Sinj and Drniš, passing from Karakašica through the villages of Muć, Ramljane, Kljake, Ružić, Gradac and again to Miočić. The altitudes of the investigated area range from 280 to 1508 m a.s.l. The total surface area of the study area is ca 418 km<sup>2</sup>.

Floristic research was conducted in the period from 2013 to 2019 using the standard method (NIKOLIĆ *et al.*, 1998; NIKOLIĆ, 2006). All seasons and different types of natural and anthropogenic habitats were covered. Altogether, 70 localities were investigated within the boundaries described above (Fig. 2). For each locality, the Gauss-Krüger coordinates of the central point were taken, and vascular plant taxa in a radius of approximately 100–200 m were recorded. Some localities were visited several times from February to October, most of them at least twice a year, but a few only once.

**Fig. 2.** The borders of the studied area on the Mt Svilaja with the position of the investigated localities (1–70, see Tab. 1).

The list of taxa includes all species and subspecies found to grow wild in the area. Of the cultivated taxa, only those that have the ability to spread outside cultivation ("gardenscapes") were recorded. Previously recorded taxa not confirmed by this study are also included. Plant taxa found exclusively in cultivation are shown in a separate list (App. 2, Tab. 2), and were not included in the analysis of flora.

Taxa were identified using the standard keys, books and guides: TUTIN *et al.* (1968–1980, 1993), PIGNATTI (1982), DOMAC (1994), NIKOLIĆ (2019), WALTERS *et al.* (1986–2000), DELFORGE (2006). The nomenclature of plant taxa, including higher taxonomic rank, mainly follows *Flora Croatica Database, FCD*, (NIKOLIĆ, 2020a). For a number of taxa not represented in *FCD*, WALTERS *et al.* (1986–2000) and DELFORGE (2006) were used, and these were marked with an asterisk (\*) in the floristic list.

Biological form was verified in the field and denoted according to categories reported in PIGNATTI (1982), these being based on the classification of RAUNKIAER (1934): Ch (Chamaephyta), G (Geophyta), H (Hemicryptophyta), Hy (Hydrophyta), P (Phanerophyta) and T (Therophyta).

Regarding chorological form, the classification of the plant taxa into floral elements and lower categories has been performed according to HORVATIĆ *et al.* (1967/1968). The names of the floral elements with the corresponding abbreviations used in the floristic list are shown in Tab. 7 in the Results and Discussion section.

Plant taxa considered endemic to Croatia (NIKOLIĆ *et al.*, 2015) are marked with the abbreviation "end". Croatian statutorily strictly protected taxa, defined by Croatian laws (ANONYMOUS, 2013), are marked as "sp". The threat status of taxa was determined according to the Red Book of Vascular Flora of the Republic of Croatia (NIKOLIĆ & TOPIĆ, 2005; NIKOLIĆ, 2020b) and marked using the abbreviations as follows: CR (Critically Endangered), EN (Endangered), VU (Vulnerable). According to precautionary criteria, the following categories were also highlighted: NT (Near Threatened), DD (Data Deficient), and LC (Least Concern). The taxa that are considered invasive alien species in Croatia (BORŠIĆ *et al.*, 2008; NIKOLIĆ *et al.*, 2014; NIKOLIĆ, 2020c) are accompanied by the abbreviation "inv".

Locality numbers (1–70, see Fig. 2 and Tab. 1) were attributed to each taxon. In addition, for taxa reported from the literature, the author name and corresponding year were indicated. Should previous records not have been confirmed during this study, only the name of locality (toponym) has been used, as presented in the original publication. In the list of flora (App. 1, Tab. 1), the author name abbreviations were used as follows:

A-1911 (ADAMOVIĆ, 1911); A-1929 (ADAMOVIĆ, 1929); De-2010 (DELIĆ, 2010); Df-2006 (DELFORGE, 2006); Ja-1908 (JANCHEN, 1908); Ja-1910 (JANCHEN, 1910); Je-1952 (JEDLOVSKI, 1952); Kr-2005 (KRANJČEV, 2005); K&S-2016 (KRANJČEV & ŠEŠOK, 2016); Ku-1969 (KUŠAN, 1969); L&al-1987 (LOVRIĆ *et al.*, 1987); L&R-1989 (LOVRIĆ & RAC, 1989); LRS-1989 (LOVRIĆ *et al.*, 1989); Ma-1964 (MARKOVIĆ, 1964); Ma-1992 (MARKOVIĆ, 1992); Me-1972 (MEŠTROVIĆ, 1972); VRZ-2012 (VLADOVIĆ *et al.*, 2012); V&al-2019 (VLADOVIĆ *et al.*, 2019); Mi&al-2013 (MILJOVIĆ *et al.*, 2013); M&K-2016 (MILJOVIĆ & KARAĐOLE, 2016); Pe-1832 (PETTER, 1832); Se-2016 (ŠEGOTA, 2016); Se&al-2016 (ŠEGOTA *et al.*, 2016); Tr-1992 (TRINAJSTIĆ, 1992); Vi-1842 (VISIANI, 1842); Vi-1847 (VISIANI, 1847); Vi-1852 (VISIANI, 1852); Vi-1872 (VISIANI, 1872).

## RESULTS AND DISCUSSION

### Flora

Based on the literature data and our own research, the first comprehensive list of vascular flora of Mt Svilaja was made (App. 1, Tab. 1). Altogether, it contains 1285 taxa i.e., nearly 25% of the total flora in Croatia (NIKOLIĆ, 2020a). In addition, 56 taxa were found exclusively in cultivation (App. 2, Tab. 2). The separate list of cultivated taxa can serve as a starting point for some future research of cultivated flora in the area.

The total number of taxa on Mt Svilaja is higher than on Mosor (872 taxa), Kozjak (604), and Matokit (604), and more or less similar to those on Risnjak (1148 taxa), Papuk (1223) and Biokovo (~1400) (Tab. 2). These differences can be explained by size and altitude range of the massifs, geographical position, climatic conditions and related phytogeographical characteristics, and degree of the scientific knowledge about each of them. For example, the lower number of taxa on Svilaja than on Biokovo was expected due to the absence of taxa from the Mediterranean-climate evergreen ecosystems [e.g., *Arbutus unedo* L., *Pinus halepensis* Mill., *Aurinia sinuata* (L.) Griseb., taxa of the genus *Cistus* L., *Euphorbia characias* L. subsp. *wulfenii* (Hoppe ex W.D.J.Koch) Radcl.Sm. (found only in cultivation), *Juniperus phoenicea* L., *Quercus ilex* L., *Tanacetum cinerariifolium* (Trevir.) Sch.Bip., etc.]. In this study, *Salvia officinalis* L. was very rare and found with a few individuals only near the village of Lemeš (x = 4861547, y = 5607414). VLADOVIĆ et al. (2019) have reported it for Sutina. In addition, LOVRIĆ et al. (1987) observed that the association *Stipo-Salvietum officinalis* Horvatić (1956) 1958 is frequent on the lower altitudes of Svilaja.

**Tab. 2.** The number of taxa (species and infraspecific taxa) on the Mt Svilaja and its comparison to other mountains in Croatia.

Mountain	Max. altitude (m a.s.l.)	Vegetation region	No. of taxa	Source
Biokovo	1764	Mediterranean	~1400	ŠILIĆ & ŠOLIĆ, 2002
Matokit	1062	Mediterranean	604	VITASOVIĆ-KOSIĆ <i>et al.</i> , 2020
Mosor	1340	Mediterranean	872	VLAĐOVIĆ, 1994
Kozjak	779	Mediterranean	604	KAMENJARIN, 1996
Svilaja	1508	Euro-Siberian	1285	This study
Risnjak	1528	Euro-Siberian	1148	<a href="https://np-risnjak.hr/flora/">https://np-risnjak.hr/flora/</a>
Papuk	953	Euro-Siberian	1223	PANDŽA, 2010

The number of taxa recorded should not be considered final. Some localities, particularly at higher altitudes, were impossible to visit in all seasons. Subsequent research should further reconsider some doubtful and dated records of taxa. Although this study was conducted at 70 localities that cover the entire area of Svilaja, it still gives only a partial insight into the distribution of individual taxa.

### Previously recorded and doubtful taxa

Of the total number of taxa (1285) on Mt Svilaja, 1157 taxa were found during our own field research from 2013 to 2019. Among them, 552 taxa are listed for the first time for the mountain. We did not confirm findings for 128 of the 733 previously recorded taxa. Findings of some taxa reported from the literature still remain dubious, and further investigation needs to be done to complete the picture of flora.

In this study, we have omitted several previously recorded orchid taxa (KRAJČEV, 2005). *Ophrys corniculata* R.Kranjčev is not valid. Additionally, some taxa reported from DELFORGE (2006a, b) and NIKOLIĆ (2020a) do not occur on the territory of Croatia: *Ophrys holubyana* Andrasovszky, *O. philippei* Gren., *O. aegirtica* P.Delforge, *O. annae* Devillers-Tersch. & Devillers, *O. gracilis* (Büel, O.Danesch & E.Danesch) Englmaier, *O. linearis* (Moggr.) P. Delforge, Devillers & Devillers-Tersch. *Micromeria parviflora* Rchb. and *Minuartia juniperina* (L.) Maire & Petit, reported by LOVRIĆ & RAC (1989) for "Svilaja Mountain range" (Svilaja and Veliki Kozjak), were also omitted, since Flora Croatica Database (FCD) does not recognize them as members of the Croatian flora (NIKOLIĆ, 2020a). In addition, the taxon *Hieracium balbisianum* Arv.-Touv. & Briq. was also not included in the floristic list. JENCHEN (1908) found it on the southern slopes of Svilaja, but his finding has never been confirmed, including this study. As a consequence it was not included in FCD (NIKOLIĆ, 2020a).

Previously, only about 400 taxa were known for the Svilaja area (MILOVIĆ *et al.*, 2020). These data originated from the published data in the 19<sup>th</sup> and early 20<sup>th</sup> centuries (PETTER, 1832; VISIANI, 1842, 1847, 1852, 1872; JANCHEN, 1908), in the second half of the last century (MARKOVIĆ, 1964, 1992; LOVRIĆ *et al.*, 1987, 1989; LOVRIĆ & RAC, 1989, TRINAJSTIĆ, 1992) and in more recent articles (KRAJČEV, 2005; ŠEGOTA, 2016; ŠEGOTA *et al.*, 2016, MILOVIĆ *et al.*, 2013, MILOVIĆ & KARAĐOLE, 2016). The largest number of previously recorded taxa (519) originated from the recently published professional publication "Significant Landscape of Sutina" (VLAĐOVIĆ *et al.*, 2019). However, we did not

include several taxa from this publication, i.e. those taken from DEGEN *et al.* (1908), because Sutina is not only a site on Svilaja, but a site with the same name exists on the slopes of Mt Dinara near the village of Ježević, an area not included in this study. JANCHEN (1908: 77) has already drawn attention to the confused state of records at localities that have the same name.

In our study, among the taxa listed in VLADOVIĆ *et al.* (2019), as many as 66 taxa were not confirmed. Actually, half of the surface area of "Sutina" is located outside the boundaries of our study area (on the northern slopes of the hill Visošnica).

We have included several endemic taxa from previous studies, although some of them can be considered doubtful for the mountain. Among them, the record of *Asperula scutellaris* Vis. is doubtful (LOVRIĆ & RAC 1989, "Svilaja mountain range"). According to BOGDANOVIC (2015a), this plant species occurs only on Vis Archipelago and Dugi Otok island, while other records (e.g., the island of Pag, Mt Svilaja) are also doubtful.

The Croatian endemic *Chouardia lakusicii* (Šilić) Speta reported by ŠEGOTA (2016) from the southern slopes of Svilaja may also be reconsidered. In this study, this species was not found. As the morphologically very similar *Ch. litardierei* (Breistr.) Speta is abundant in the surrounding flooded areas and on damp habitats (Cetinsko Polje, Vrličko Polje and Sinjsko polje, the Sutina stream), we assume that the previously noted record of *Ch. lakusicii* should most likely really be that of *Ch. litardierei*, whose seeds have been spread by birds to dry grasslands. The first author of this article has also found individuals of *Ch. litardierei* on a dry meadow along the edge of the Čikola Canyon near the village of Brnjica.

The presence of *Crocus tommasinianus* Herb. is also doubtful. LOVRIĆ *et al.* (1989) reported this species from the highest altitude grasslands ("Svilaja Mountain range") of Svilaja and Veliki Kozjak, and ŽEVRNJA & VLADOVIĆ (2005) for the village of Neorić. The photo of "*C. tommasinianus*" from ŽEVRNJA & VLADOVIĆ (2005) includes the purple tube of the perigone and it may be concluded that the taxon actually belongs to *C. purpureus* Weston [*C. neapolitanus* (Ker Gawl.) Ascherson], distributed over the entire Svilaja, and also frequent in Neorić.

## Floristic analysis

The vascular flora of Svilaja contains 1285 species and subspecies classified within 502 genera and 109 families (Tab. 3). The average number of taxa per family and genus is 11.79 and 2.56, respectively.

The families with the highest number of taxa (Tab. 4) were *Poaceae* (113 taxa, 8.79%), *Asteraceae* s. str. and *Fabaceae* (112 taxa each, 8.72%), which together made up 26.23% of the taxa of the total vascular flora on Svilaja. These families also prevail in the flora of some other areas in Croatia: Šibenik and its surroundings (MILOVIĆ, 2002), Papuk (PANDŽA, 2010), Biokovo (RADIĆ, 1976), Mosor (VLADOVIĆ, 1994) and Matokit (VITASOVIĆ-KOSIĆ *et al.*, 2020), as well as in the total flora of Croatia (NIKOLIĆ & TOPIĆ, 2005).

Sixteen genera contained more than 10 taxa. The genera with the highest number of taxa were: *Trifolium* (23 taxa), *Carex* (20), and *Centaurea* (17) (Tab. 5). These taxa contributed the most in the vegetation of dry grasslands on Svilaja.

**Tab. 3.** The number of taxa of the flora of Mt Svilaja

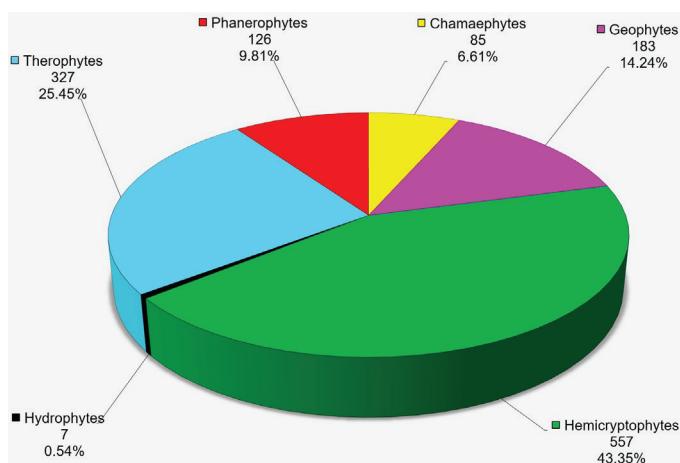

Taxon	Pteridophytes	Gymnosperms	Angiosperms		Total
			Dicots	Monocots	
Families	7	2	84	16	109

**Fig. 3.** Life-form spectrum on the Mt Svilaja.

## Analysis of life forms and geoelements

The analysis of life forms (Fig. 3) showed the predominance of hemicryptophytes (557 taxa, 43.35%) and therophytes (327, 25.45%). Geophytes (14.24%) and phanerophytes (9.81%) contributed significantly lower. The dominance of hemicryptophytes and therophytes is in accordance with the climatic conditions and the dominant types of vegetation units (RAUNKIER, 1934; HORVAT, 1949, MILOVIĆ *et al.*, 2020).

The mountain is located on the border of the Euro-Siberian and Mediterranean vegetation regions, where the climate becomes colder and wetter as the altitude increases, and the influence of the Mediterranean climate becomes weaker. The vegetation is dominated by grasslands, thickets and forests which often contain hemicryptophytes. Therophytes frequently occur in the anthropogenic habitats (settlements, agricultural areas) located on the lower slopes of Svilaja. However, for a simple illustration, Svilaja had a lower percentage contribution of hemicryptophytes and a higher of therophytes than Papuk (in continental Croatia) and *vice versa*. Additionally, a higher contribution of hemicryptophytes and a lower of therophytes were found on Mosor due to lower altitudes and closer proximity to the Adriatic coast, and Šibenik (coastal area with a Mediterranean climate) as well as in the spectrum of life forms of the Mediterranean as a whole (Tab. 6).

**Tab. 6.** Life-form spectrum of Mt Svilaja in comparison to Mt Mosor (VLADOVIĆ, 1994), Mt Papuk (PANDŽA, 2010), Mt Matokit (VITASOVIĆ-KOSIĆ *et al.*, 2020), Šibenik and surroundings (MILOVIĆ, 2002) and in the Mediterranean region as a whole (HORVAT, 1949). P – phanerophytes, Ch – chamaephytes, H – hemicryptophytes, G – geophytes, T – therophytes, Hy – hydrophytes.

Area	Life-form (%)					
	P	Ch	H	G	T	Hy
Mediterranean	12	6	29	11	42	-
Šibenik and surroundings	8.84	6.51	30.33	10.51	42.79	1.02
Mt Mosor	14.92	9.28	35.14	11.79	28.43	0.47
Mt Svilaja	9.81	6.61	43.35	14.24	25.45	0.54
Mt Matokit	10.76	10.76	39.90	12.42	26.16	-
Mt Papuk	12.43	3.52	48.16	12.92	20.52	2.45

The Mediterranean geoelement (299 taxa, 23.27%), mostly circum-Mediterranean plants, was followed by a considerable proportion of South European (269, 20.93%) and Eurasian (224, 17.43%) plants (16.99 %) (Tab. 7). This was expected due to the geographical and the phytogeographical position of the mountain. The influence of the Mediterranean climate on Svilaja is less pronounced than on Mosor and Šibenik, which is reflected in the significantly lower contribution of the Mediterranean geoelement (Tab. 8). On the other hand, the presence of widespread plants (14%), and cultivated and alien plants (7.24%) may be used as an indicator of the intensity of human influence. These plant species were less common in the higher altitudes and uninhabited areas than on the lower slopes of Svilaja where the anthropogenic impact is more pronounced.

**Tab. 7.** Analysis of the geoelements on the Mt Svilaja

Mt Svilaja	23.27	20.93	17.43	4.12	14.00	7.24
Mt Papuk	1.96	17.83	27.39	12.18	17.58	6.54

## Endemic, endangered and protected plant taxa

In total, 202 taxa (15.72%) belong to at least one of the groups of special interest for conservation (endemics, endangered or strictly protected taxa, *sensu* Croatian law). There are no real mountain endemics. Seventy-six taxa (5.91%) were considered to be endemic (Tab. 9, *sensu* NIKOLIĆ *et al.*, 2015), mostly belonging to the group of Illyrian-Adriatic endemics. Croatian endemic taxa presented on Svilaja are: *Arenaria orbicularis* Vis., *Iris adriatica* Trinajstić ex Mitić, *Knautia adriatica* Ehrend, *K. dalmatica* Beck, *Ophrys dinarica* Kranjc̄ev & P.Delforge, *O. liburnica* Devillers & Devillers-Tersch., *O. rhodostephane* Devillers & Devillers-Tersch., etc.

**Tab. 9.** Number of taxa of special interests for conservation in Croatia found on Mt Svilaja

Category	No. of taxa	% of total no. of taxa
Endemics (end; <i>sensu</i> Nikolić <i>et al.</i> , 2015)	76	5.91
Critically Endangered (CR)	1	0.08
Endangered (EN)	8	0.62
Vulnerable (VU)	25	1.95
CR+EN+VU	34	2.65
Near Threatened (NT)	33	2.57
Data Deficient (DD)	38	2.96
Least Concern (LC)	21	1.63
NT + DD + LC	92	7.16
Croatian strictly protected (sp)	155	12.06

The contribution of endemics on Svilaja may be compared to that on Matokit (5.30%), but it is lower than in Paklenica National Park (9.77%) in the southern Velebit (ALEGRO, 2004).

Among the endemics, the presence of *Scabiosa delminiana* Abadžić should be stressed. This plant was recently described as new for science on Mt Lip (Lib) on the edge of Duvanjsko Polje in neighboring Bosnia and Herzegovina (ABADŽIĆ, 2007). Until now, the only known locality in Croatia so far was along the Butižnica River, a tributary of the Krka River (ABADŽIĆ, 2007; NIKOLIĆ *et al.*, 2014). We found a large population with several hundred individuals on the sub-Mediterranean montane calcareous rocky grasslands on shallow soils of the alliance *Saturejion subspicatae* Tomić-Stanković 1970, on the southeastern slopes on the locality of Orlove Stine ( $x = 4848222$ ,  $y = 6381723$ ) not far from the hiking lodge.

Further, the endemic taxon *Hyacinthella dalmatica* (Baker) Chouard, common in Dalmatia, is abundant on rocky and hilly grasslands on the northern (Lemeš, Maovice, Vrlika) and the southern slopes (Ogorje, Zelovo) of Svilaja.

In total, 34 taxa (2.66%) are included in the Croatian Red List (NIKOLIĆ & TOPIĆ, 2005, NIKOLIĆ, 2020b). One species (*Vaccaria hispanica* (Miller) Rauschert) is Critically Endangered (CR). Eight taxa (e.g., *Delphinium peregrinum* L., *Hibiscus trionum* L., *Hordeum secalinum* Schreb., *Ophrys apifera* Huds., etc.), are considered Endangered (EN), while 25 are classified as Vulnerable (VU), i.e., *Alopecurus rendlei* Eig., *Arctostaphylos uva-ursi* (L.) Spreng., *Ilex aquifolium* L., *Lilium carniolicum* Bernh. ex W.D.J.Koch,

*Ophrys bertolonii* Moretti, *Orchis militaris* L., *O. simia* Lam., *Platanthera bifolia* (L.) Rich., *Polygonatum latifolium* (Jacq.) Desf., etc.

In total, 92 taxa have been classified as Nearly Threatened (NT), Least Concern (LC), or Data Deficient (DD) (NIKOLIĆ & TOPIĆ, 2005, NIKOLIĆ, 2020b). Some of these taxa are *Hymenolobus procumbens* (L.) Nutt., *Hyssopus officinalis* L., *Polycnemum arvense* L., *Pulsatilla grandis* Wender., *Ruscus aculeatus* L., *Teucrium arduini* L., *Tulipa sylvestris* L., etc.

In total, 155 taxa (12.06%) found on Svilaja are strictly protected in Croatia (ANONYMOUS, 2013). This also includes all endemics, endangered taxa, orchids (*Orchidaceae*), and taxa from the genera *Dianthus* and *Iris*, etc.

Svilaja is characterized by a rich orchid flora containing 51 taxa (3.97%) and includes several endemic taxa of the genus *Ophrys*: *O. dinarica* Kranjčev & P.Delforge, *O. liburnica* Devillers & Devillers-Tersch., *O. rhodostephane* Devillers & Devillers-Tersch., *O. sphegodes* Mill. subsp. *tommasinii* (Vis.) Soó, *O. tetraloniae* W.P.Teschner and *O. untcchii* (M.Schulze) P.Delforge. The high number of orchid taxa found on Svilaja, especially on its southwestern slopes in the vicinity of Muć, has also been pointed out by several authors (GOLUBIĆ, 1999, 2001; KRANJČEV, 2005; DELFORGE, 2006; MILOVIĆ *et al.*, 2013; ŠEGOTA, 2016). Rocky dry grasslands and open forests that occupy relatively large areas on Svilaja represent favourable habitats for various orchid species. The taxa *Ophrys annae* Devillers-Tersch. & Devillers, *O. gracilis* (Büel, O.Danesch & E.Danesch) Englmaier and *O. serotina* Rolli ex Paulus, reported for Svilaja (Muć, Postinje) by KRANJČEV (2005) are designated as doubtful in FCD (NIKOLIĆ, 2020).

DELFORGE (2006a) visited several localities on Svilaja in the period from 2002 to 2006, and concluded that (i) *O. annae*, *O. gracilis*, and *O. serotina* do not occur in Croatia, (ii) the findings of KRANJČEV (2005) published under the above mentioned names have to be attributed to the taxon *O. tetraloniae*, (iii) two hybrids also grow on Svilaja: *Ophrys × kranjcevii* P.Delforge (*O. dinarica* × *O. untcchii*) in Karakašica, and *Cephalanthera × schulzei* E.G.Camus, Bergon, A.Camuis (*C. damasonium* × *C. longifolia*) in Zelovo, (iv) of particular importance is the record of *Epipactis placentina* Bongiorni & Grünanger from Zelovo (site 262, XJ2344, 780 m a.s.l.). This is the first record of *E. placentina* for Croatia and needs to be included in the FCD. We found a population of about 100 individuals of *E. placentina* in the forest near Gornje Ogorje, south of the settlements of Šunjići and Jelavići (x = 4844918, y = 6382266).

### Rare species of Croatian and Dalmatian flora on Svilaja

This section reports the records of several rare taxa either for a whole Croatian territory or for Dalmatia with the aim of contributing to the current state of knowledge of their distribution range (for details on the previous distribution range for each taxon see FCD; NIKOLIĆ, 2020a).

*Achnatherum calamagrostis* (L.) P.Beauv. (*Poaceae*) is a South European-montane taxon, known only in a few localities in Croatia: in the northern part of the Krka National Park (Grčići), next to Krčić waterfall, the spring of the Una River, on Mt Dinara (Brezovac) and on the island of Hvar. On Svilaja, it occurs along the edges of the mountain road south of the Orlove Stine hiking lodge (x = 4847487, y = 6381670; x = 4847029, y = 6381313).

*Carlina acanthifolia* All. (*Asteraceae*) occurs predominantly in the mountainous areas of southern and eastern Central Europe. It is relatively rare in Croatia (Istria, Gorski Kotar, Lika, Nova Gradiška in Slavonia). The records on Svilaja (Lemeš, Razvale Maovičke, Orlove Stine) are currently the southernmost in Croatia.

*Delphinium fissum* Waldst. & Kit. (*Ranunculaceae*) is a Eurasian species that grows on mountain pastures. In Croatia, it is known only at a few sites: Paklenica, Poljica Kozička and Mosor. Several individuals were found on the grasslands on the southern slopes of Orlove Stine.

*Dianthus carthusianorum* L. subsp. *sanguineus* (Vis.) Hegi (*Caryophyllaceae*) is rare in terms of the number of localities in Croatia. It is found in Istria, Samobor Hills and at several sites in Lika. In Dalmatia, the only record originated from Mt Biokovo (RADIĆ, 1976). In this study, we found it in Gornje Ogorje (between Tešije and Jeličići).

*Erodium acaule* (L.) Bech. & Thell. (*Geraniaceae*) is a Mediterranean-montane plant species that was recently included in Croatian flora based on findings from southern Istria and the island of Krk (TOPIĆ *et al.*, 1998). It was later found in the vicinity of Bibinje and on the island of Silba, northern Dalmatia (BOGDANOVIĆ *et al.*, 2013), but it probably has a wider distribution in the coastal area of Croatia. Some authors have so far not distinguished it from the morphologically similar *E. cicutarium* (L.) L' Hér. This therophyte grows mostly as a weed in crops, while *E. acaule* occurs on dry places, mostly in rocky grasslands and garrigues (TOPIĆ *et al.*, 1998). On Svilaja, we found it in several localities on dry grasslands near Lemeš, next to the Sv. Jure hiking lodge, in Maovice (between Režići and Baturine), Maljkovo and near the settlement of Vrba.

*Euphorbia barrelieri* Savi subsp. *hercegovina* (Beck) Kuzmanov (*Euphorbiaceae*) is a subspecies endemic to Croatia, Bosnia and Herzegovina, and Montenegro. Its taxonomic status with respect to the morphologically similar *E. triflora* Schott, Nyman & Kotschy has not yet been fully resolved (JASPRICA *et al.*, 2009; NIKOLIĆ *et al.*, 2014; FRAJMAN & SCHÖNSWETTER, 2017). In Croatia, it was known only from sites in the vicinity of Cavtat and on Pelješac Peninsula. The record from Svilaja originated from the area of Lučani (x = 4843059, y = 6387053).

*Gentiana dinarica* Beck (*Gentianaceae*) is endemic to the Dinarides (Croatia, Bosnia and Herzegovina, Montenegro). It occurs on alpine and subalpine calcicolous swards (ŠILIĆ, 1984). The only record for Croatia originated from the southwestern slopes of Svilaja, above the settlements of Ogorje and Zelovo (ŠEGOTA, 2016). Additionally, we found a larger population of *G. dinarica* on rocky grassland in the vicinity of the hiking lodge below Orlove Stine (x = 4848174, y = 6381626).

*Gypsophila fastigiata* L. (*Caryophyllaceae*) is a central and eastern European species that favours continental ridged forests, sandy soils and calcareous rocks. In Croatia, it is found on the southern border of its distributional range, but known only at a few sites: Mt Kalnik and North Velebit National Park. On Svilaja, it was found on dry grasslands in several places south of Orlove Stine (x = 4847991, y = 6381653; x = 4847024, y = 6381289).

*Ilex aquifolium* L. (*Aquifoliaceae*) is an endangered (VU) taxon in Croatia. It grows in beech forests. In Svilaja, several individuals were found in a beech forest near Sutina (x = 4841226, y = 6384924). This is the only record in Dalmatia and the southernmost locality for Croatia. TAFRA *et al.* (2012) reported this species from cultivation in Omiš.

*Iris adriatica* Trinajstić ex Mitić (Iridaceae) is an endemic taxon for the coastal area and islands in northern and central Dalmatia. On Svilaja, a population of a hundred individuals has been found on rocky grassland, along the Drniš-Vrlika road, near Štikovo ( $x = 4861624$ ,  $y = 5604635$ ). This is the locality the most remote from the Adriatic coast.

*Knautia adriatica* Ehrend. and *K. dalmatica* Beck (Dipsacaceae) are Croatian endemics from Dalmatia. *Knautia adriatica* occurs in the vicinity of Zadar and Biograd and in the hinterland of Šibenik (Trtar), while *K. dalmatica* grows on Kamešnica, Mosor, Svilaja, Kozjak and the island of Brač (BOGDANOVIĆ, 2015b). The area of Svilaja represents the boundary between the ranges of these two species. A small population of *K. adriatica* was found on the rocky grassland in Ogorje (Kokani) next to wind turbines ( $x = 4842708$ ,  $y = 6381648$ ) and in the vicinity of the Golubinka pit ( $x = 4847265$ ,  $y = 5621393$ ). Several individuals of *K. dalmatica* were found in the vicinity of Čavoglave ( $x = 4849815$ ,  $y = 5607759$ ) and along the hiking trail east of Crni Umac.

*Knautia clementii* (Beck) Ehrend. (Dipsacaceae), endemic to the central Dinarides, occurs in Croatia and Bosnia and Herzegovina. In Croatia, it has been recorded at several localities on central and southern Velebit, on Dinara and near Vrlika (Ježević) (BOGDANOVIĆ, 2015a). Specimens of this plant species were collected on a hilly grassland between Ogorje and Zelovo.

*Knautia travnicensis* (Beck) Szabó (Dipsacaceae) is endemic to the central Dinarides (Croatia and Bosnia and Herzegovina). In Croatia, it is known for several localities on Velebit, Dinara and Plješivica. On Svilaja, a new locality for Croatia was discovered between Ogorje and Zelovo.

*Lamium bifidum* Cirillo (Lamiaceae) is a eu-Mediterranean taxon, found in Croatia only at a few localities: Trogir and Svilaja (VISIANI, 1847: 211), Seoci and Kotlenice on Mosor (VLADOVIĆ & ILIJANIĆ, 1993), and Sutina on Svilaja (VLADOVIĆ *et al.*, 2019). According to the presence of several images in FCD (uncoded data), the species was also found in the island of Brač and vicinity of the town of Cavtat in South Dalmatia. We found several individuals in the vicinity of Raketići stables ( $x = 4859944$ ,  $y = 5602552$ ).

*Lathraea squamaria* L. (Scrophulariaceae) is a species of Eurasian distribution that parasitizes on the roots of deciduous trees (PIGNATTI, 1982). In Croatia, it is distributed in continental part of the country, and in Trilj, which is the only site in Dalmatia. We found several individuals in Vrlika, in the forest near the Česma spring (Vrilo).

*Linum hirsutum* L. (Linaceae) is a central-eastern European – Pontic species (PIGNATTI, 1982). It is known from several localities in continental Croatia, while in the coastal part of Croatia it has been recorded only in two areas in Dalmatia: on Hrvatačko Polje and Pelješac Peninsula. We found a large population on the grasslands along the road through Lučane.

*Lomelosia graminifolia* (L.) Greuter & Burdet (Dipsacaceae) is a southern European species of colline and montane areas (PIGNATTI, 1982). In Croatia, it has been recorded in Gorski Kotar, Velebit, Plješivica and Biokovo. On Svilaja, it is widespread on limestone grasslands. We found it in several localities, especially along the hiking trail from Ogorje to Orlove Stine.

*Moenchia mantica* (L.) Bartl. (Caryophyllaceae) is a northern Mediterranean species (PIGNATTI, 1982). It is widespread in continental Croatia, but rare in the coastal area. It

was found on Dinara (TRINAJSTIĆ & ŠUGAR, 1972), Mosor (VLADOVIĆ & Ilijanić, 1992) and on the island of Vis (DOMAC, 1955). We found it at two sites on Svilaja, in Maovice (between Režići and Baturine) and Zelovo (Lađa).

*Nigella arvensis* L. (*Ranunculaceae*) grows most commonly in cereal fields. Most of the sites were found in continental Croatia, but they are rare in the Croatian coastal area: Donji Kamenjak (Istria), Šibenik, Solin, Hrvatačko Polje, the islands of Brač, Korčula and Mljet, and Trsteno near Dubrovnik. It was once widespread in Dalmatia (VISIANI, 1852; "in agris et satis totius Dalmatiae"), but due to the abandonment of areas of cereal cultivation it became very rare. We found it on the western slopes of Svilaja (Gradac).

*Odontites vulgaris* Moench (*Scrophulariaceae*) is a Eurasian species common in continental Croatia and in the northern Adriatic, and it is very rare in Dalmatia: Krka National Park (Visovac) and Split. Previously reported data for Zadar, Drniš, and Dubrovnik (VISIANI, 1847: 174) have not been confirmed in recent times. The species has already been reported for Sutina (VLADOVIĆ et al., 2019), and we found it on the southwestern slopes of Svilaja, in Gradac and Mirlović Polje (Vrba, Čikola).

*Onobrychis alba* (Waldst. & Kit.) Desv. (*Fabaceae*) is a circum-Mediterranean species. In Croatia, only a typical subspecies is present, and in only a few localities: Zagreb (Maksimir), Risnjak, Kozjak, Mosor, Biokovo and Snježnica (Konavle), and on the island of Čiovo. Several individuals were found in Gornje Ogorje (Kokani) and in the vicinity of Grabići.

*Onopordum acanthium* L. (*Asteraceae*) is a Eurasian species, relatively rare in continental Croatia, and even rarer along the Adriatic coast and the islands. In Dalmatia, it is known only from a few localities in the Krka National Park, Cetinsko Polje and Sinjsko Polje. The records from Drniš and the island of Hvar (VISIANI, 1847: 45) have not been recently confirmed. In this study, it is found in the several localities: Vrlika, Otišić, Maljkovo, Donje Ogorje, Bidnići and Gornje Ogorje (Kokani). This study confirmed the findings of VISIANI (1847: 45), from ruderal habitats on the hills around Sinj.

*Oxytropis dinarica* (Murb.) Wettst. (*Fabaceae*) is endemic to the Dinarides. In Croatia, it is distributed on Risnjak, Velebit, Poštak, Dinara and Biokovo. In this study, *O. dinarica* was found on meadows in the highest altitudes as LOVRIĆ et al. (1989) have previously reported.

*Pedicularis brachyodonta* Schloss. & Vuk. (*Scrophulariaceae*) is a taxon distributed in the northern and central parts of the Balkans. In Croatia, it is known on Klek (near Ogulin), Velebit, Šatorina and Plješivica. LOVRIĆ et al. (1989) reported the species from Svilaja and Veliki Kozjak, but we could not confirm their finding.

*Petteria ramentacea* (Sieber) C.Presl (*Fabaceae*) is an Illyrian-Balkan endemic species. In Croatia, it is found in central and southern Dalmatia. LOVRIĆ et al. (1987) reported it from the "southern dolomite slopes of Svilaja towards Muć and Dicmo". In this study, its presence was not confirmed.

*Rapistrum rugosum* (L.) All. subsp. *rugosum* (*Brassicaceae*) is a species of circum-Mediterranean distribution. On the species level (*R. rugosum*), it was recorded in Istria and the Kvarner islands, while records from Dalmatia seem to be rare and mostly originated from the 19<sup>th</sup> century (VISIANI, 1852: 105). On the subspecies level, it

is known only from a few localities in Istria. The locality on Svilaja (Otavice) is only one outside of Istria.

*Rubus candicans* Weihe ex Rchb. (*Rosaceae*) is distributed in southern, western and central Europe. It is rare in Croatia, found mostly in the western part of the country and in Istria (Učka). On Svilaja, it was found only in the area of Samar.

*Sambucus racemosa* L. (*Caprifoliaceae*) is a circumboreal species that occurs mainly in the highest mountain forests. In Croatia, it is distributed in the area of Učka, Gorski Kotar, Velebit and Lika. In Dalmatia, it was recorded on Dinara and Pelješac Peninsula. On Svilaja, we recorded it in a burnt beech forest in Samar.

*Scrophularia bosniaca* Beck (*Scrophulariaceae*) is endemic to the southeastern Dinarides (Croatia, Bosnia and Herzegovina, Montenegro, Kosovo and Albania), and is mostly found in beech forests, rock crevices and ravines (Šilić, 1984). Until now, it was found on Dinara, while on Svilaja it was observed in the rock crevices of Lisina and Samar.

*Seseli elatum* L. subsp. *gouanii* P.W.Ball (*Apiaceae*) is endemic to northern Italy and the western part of the Balkans (Slovenia, Croatia and Bosnia and Herzegovina). In Croatia, the largest number of localities was observed in Hrvatsko Primorje and on Velebit, and others were also found in Istria (Ćićarija), Gorski Kotar and Gola Plješivica in Lika (Mišović, 2015). The finding on Svilaja (Orlove stine) is the only one in Dalmatia.

*Silene sendtneri* Boiss. (*Caryophyllaceae*) is endemic to the Dinarides, known in Croatia for only a few localities in Gorski Kotar, Plitvice Lakes and Dinara. Lovrić *et al.* (1989) reported it, without specifying precise localities, for Veliki Kozjak and Svilaja. We found this taxon on a hilly meadow below Orlove stine (ca. 1000 m a.s.l.).

*Stachys thirkei* K.Koch (*Lamiaceae*) is distributed in the northeastern Mediterranean. In Croatia, the most localities were found in the Krka River Canyon, and others were also reported from Kvarner in the north to Biokovo in the south. On Svilaja, the species is very frequent (found in 18 localities) at lower altitudes. This species probably has a wider distribution in Croatia, and in some areas (Zadar, Split, Šibenik) was previously replaced by the closely related *S. cretica* L. subsp. *salviifolia* (Ten.) Rech.f.

*Tragopogon balcanicus* Velen. (*Cichoriaceae*) occurs in the northern and central Balkans. In Croatia, it was found in southern Velebit, near Šibenik, on Mosor and Biokovo, and in the Tijerica valley. On Svilaja, it was found at several localities: Čavoglave, Polje, Samar, Potravlje (Babići) and Gornje Ogorje (between Tešije and Jelićići).

*Typha domingensis* (Pers.) Steud. (*Typhaceae*) is a species of the temperate and tropical regions. In Croatia, it is known only from the island of Cres and from Lake Prokljan, the Krka River (Marković *et al.*, 1993). We believe that it has a wider distribution in the coastal part of Croatia where it is probably confused with a similar taxon *T. angustifolia* L. Cook (1980: 276) states that some of the records of *T. angustifolia* in South Europe perhaps refer to *T. domingensis*. On Svilaja, this taxon was found at several localities: Otavice, the confluence of the Vrba in Ćikola, Gornje Polje (Crivac), Radunić, the Suvova stream near Muć, Gornje Ogorje (a pond near village of Kokani). VLADović *et al.* (2019) recorded *T. angustifolia* for Sutina, and according to our opinion, this record is doubtful and may also be attributed to *T. domingensis*.

*Vincetoxicum fuscum* (Hornem.) Rchb.f. (*Asclepiadaceae*) is a Southeast European species that grows in rocky dry habitats (MARKGRAF, 1972). In Croatia, only a few

localities have been recorded for the islands of Brijuni, Cres, Krk, Lošinj and Hvar, and Ščardin (Blato na Cetini). On Svilaja, the species was found in Orlove Stine, Gornje Ogorje (Tešija) and along the hiking trail between Jačmenjaci and Gole Kose.

### Cultivated, alien and invasive species

In total, 93 cultivated and adventitious plants taxa (7.24%) were found. This is in accordance with the data obtained for Mosor and Papuk (Tab. 8), but significantly lower than in the urban areas along the Croatian coast (RUŠČIĆ, 2002; TAFRA *et al.*, 2012; MILOVIĆ & MITIĆ, 2012). Cultivated and alien plants are mainly related to ruderal and weed vegetation in settlements on the lower altitudes on Svilaja, while they are almost completely absent in the higher vegetation belts.

The most common were alien species – intentionally (for cultivation) and unintentionally introduced species with different degrees of domestication (*sensu* RICHARDSON *et al.*, 2000; PYŠEK, 2004). Among them, special attention was paid to invasive taxa that can cause disturbances in the phytocoenosis. In total, 37 taxa (2.88%) were considered invasive (for details see BORŠIĆ *et al.*, 2008, and NIKOLIĆ *et al.*, 2014) on Svilaja. The most invasive taxa were found in one to three localities only: e.g., *Acer negundo* L., *Amaranthus albus* L., *A. blitoides* S.Watson, *A. hybridus* L., *Ambrosia artemisiifolia* L., *Amorpha fruticosa* L., *Artemisia annua* L., *A. verlotiorum* Lamotte, *Bidens subalternans* DC., *Chamomilla suaveolens* (Pursh) Rydb., *Conyza bonariensis* (L.) Cronquist, *Cuscuta campestris* Yunck., *Datura wrightii* Regel, *E. prostrata* Aiton, *Juncus tenuis* Willd., *Panicum capillare* L., *Paulownia tomentosa* (Thunb.) Steud., *Sorghum halepense* (L.) Pers., and *Xanthium spinosum* L. The findings of the *Reynoutria japonica* Houtt. (Gornje polje, Crivac) and *Solidago gigantea* Aiton (Gradac), quite rare taxa along the Croatian coastal area, but widespread in the continental area of Croatia (NIKOLIĆ, 2020a), were of particular interest. The most frequent invasive species on Svilaja were: *Ailanthus altissima* (Mill.) Swingle, *Amaranthus retroflexus* L., *Broussonetia papyrifera* (L.) Vent., *Conyza canadensis* (L.) Cronquist, *Erigeron annuus* (L.) Pers., *Helianthus tuberosus* L., *Robinia pseudoacacia* L., and *Veronica persica* Poir. Additionally, MARKOVIĆ (1964) recorded an invasive species *Lepidium virginicum* L. within the ruderal vegetation in Vrlika, but the record was not confirmed in our study.

However, this study showed that distribution of aliens is localized in the anthropogenic habitats in settlements and its surroundings and, at this moment, does not pose a threat to natural habitats.

In the settlements on Svilaja, numbers of horticultural species with the ability to spread outside cultivation were recorded. They were: *Alcea rosea* L., *Aster lanceolatus* Willd., *Calendula officinalis* L., *Campsis radicans* (L.) Seen., *Fallopia baldschuanica* (Regel) Holub, *Gaillardia aristata* Pursh., *Ipomoea purpurea* Roth, *Lilium candidum* L., *Mirabilis jalapa* L., *Oxalis articulata* Savigny, *Paulownia tomentosa* (Thunb.) Steud., *Tagetes patula* L., etc. Among them, two ornamental plant species need to be highlighted: (i) *Hemerocallis fulva* (L.) L., already known from several localities in Croatia (NIKOLIĆ, 2020a), is distributed in cultivation over a large area in settlements on Svilaja. It was also found outside cultivation in Miočić, Gradac (Vidovići), between Polje and Čavoglave, Crivac, Satrić, Muć (near Suvova stream) and Karakašica; (ii) *Oenothera speciosa* Nuttall is also found in Miočić. The species has to be included in FCD as a new member of Croatian flora found for the first time outside the culture.

## CONCLUSIONS

The study provides a comprehensive floristic list of the Mt Svilaja for the first time. Mt Svilaja hosts a high number of vascular plant taxa and this confirms its position within the Western Balkans as a high biodiversity hotspot. This moderately high limestone mountain located in the transitional zone between the alpine-high-Nordic and the oro-Mediterranean floristic regions (*sensu* STEVANOVIĆ, 1996) has a humid climate with warm summers and covers a high altitude range. All these, including a long-term human impact, account for the mountain being an excellent reservoir of biodiversity, and particularly of orchids. It has a considerable proportion of Croatian endemics, and a high capacity to host important species from a conservation point of view, while having a low number of invasive plant species.

The transitional position between two floristic and vegetation (Mediterranean and Euro-Siberian) regions is also confirmed by the analysis of the life-forms and geoelements. The domination of the Mediterranean gelement can be explained by the maritime impact which results in penetration of Mediterranean species deep into the hinterland through the Cetina River Canyon (e.g., ANTONIĆ & LOVRIĆ, 1996).

## ACKNOWLEDGEMENTS

We thank our colleagues Sandro Bogdanović and Ivana Rešetnik for their help in the identification of *Knautia*; Jagoda Karađole and Robert Crnković for their help in finding the localities of several rare species on Svilaja. We also thank the reviewers for their careful reading of the manuscript and constructive suggestions.

Received October 5, 2020

## APPENDIX 1

**Tab. 1.** The vascular plant taxa of Mt Svilaja (abbreviations are explained in the section Materials and Methods).

Taxon	Family	Life form	Geoelement	Status	Localities (finding sites)	Previously recorded findings
<i>Acanthus balcanicus</i> Heywood et I. Richardson	Acanthaceae	H	ILBA-end		2, 3, 21, 23	Vi-1847:226 as <i>A. longifolius</i> Host
<i>Acer campestre</i> L.	Aceraceae	P	EURO		2, 3, 4, 5, 13, 14, 15, 16, 17, 19, 20, 22, 25, 28, 29, 37, 40, 42, 43, 44, 47, 55, 58, 60, 61, 63, 65, 69, 70	Je-1952; L&al-1987, kao <i>A. c. ssp. mariscum</i> (Guss.) Hay.; V&al-2019
<i>Acer monspessulanum</i> L.	Aceraceae	P	SEU-me		1, 6, 9, 13, 15, 20, 23, 25, 26, 27, 30, 40, 41, 46, 48, 49, 50, 59, 65	Ja-1908; L&al-1987; V&al-2019
<i>Acer negundo</i> L.	Aceraceae	P	CUAD	inv	14	
<i>Acer obtusatum</i> Willd.	Aceraceae	P	ILBA-end		14, 21, 32, 35, 36, 37, 40, 41, 42, 55, 59, 61, 66, 69	Ja-1908; L&al-1987; VRZ-2012; Mi&al-2013; V&al-2019
<i>Acer platanoides</i> L.	Aceraceae	P	EURO		32	
<i>Acer pseudoplatanus</i> L.	Aceraceae	P	EURO		14, 31, 32, 40, 53, 55, 65	

Taxon	Family	Life form	Geoelement	Status	Localities (finding sites)	Previously recorded findings
<i>Achillea clavennae</i> L.	Asteraceae	H	ME-ilape	NT	Svilaja mountain range	L&R-1989
<i>Achillea collina</i> Becker ex Rchb.	Asteraceae	H	CEU		11, 16, 18, 19, 28, 43, 59	V&al-2019

## APPENDIX 2

**Tab. 2.** The plant taxa found only in cultivation on Mt Svilaja (abbreviations are explained in the section Materials and Methods).

Taxon	Family	Life form	Finding sites (Localities)
<i>Actinidia chinensis</i> Planch.	<i>Actinidiaceae</i>	P	70*
<i>Albizia julibrissin</i> Durazz.	<i>Fabaceae</i>	P	5*
<i>Allium sativum</i> L.	<i>Amaryllidaceae</i>	G	14*, 25*, 30*, 37*, 43*
<i>Balsamita major</i> Desf.	<i>Asteraceae</i>	Ch	1*, 23*
<i>Buddleja davidi</i> Franch	<i>Buddlejaceae</i>	P	25*
<i>Buxus sempervirens</i> L.	<i>Buxaceae</i>	P	70*
<i>Canna indica</i> L.	<i>Cannaceae</i>	G	1*
<i>Capsicum annuum</i> L.	<i>Solanaceae</i>	T	3*, 16*, 22*, 24*
<i>Cedrus atlantica</i> (Endl.) Carriere	<i>Pinaceae</i>	P	14*
<i>Cicer arietinum</i> L.	<i>Fabaceae</i>	T	16*, 25*, 28*, 37*
<i>Commelinia communis</i> L.	<i>Commelinaceae</i>	G	27*
<i>Cortaderia selloana</i> (Schult. & Schult.f.) Asch. & Graebn.	<i>Poaceae</i>	H	1*
<i>Cucumis sativus</i> L.	<i>Cucurbitaceae</i>	T	1*, 16*, 24*, 70*
<i>Cydonia oblonga</i> Mill.	<i>Rosaceae</i>	P	24*, 37*, 70*
<i>Cylindropuntia imbricata</i> (Haw.) F. M. Knuth	<i>Cactaceae</i>	P	22*
<i>Dahlia variabilis</i> (Willd.) Desf.	<i>Asteraceae</i>	G	23*, 24*
<i>Daucus carota</i> L. ssp. <i>sativus</i> (Hoffm.) Arcang.	<i>Apiaceae</i>	T	16*, 22*, 37*, 70*
<i>Delosperma cooperi</i> (Hook.f.) L.Bolus*	<i>Aizoaceae</i>	Ch	27*
<i>Deutzia scabra</i> Thunb.	<i>Hydrangeaceae</i>	P	14*
<i>Erysimum cheiri</i> (L.) Crantz	<i>Brassicaceae</i>	Ch	27*
<i>Euonymus japonica</i> L. f.	<i>Celastraceae</i>	P	27*, 43*
<i>Euphorbia characias</i> L. ssp. <i>wulfenii</i> (Hoppe ex Koch) A. M. Sm.	<i>Euphorbiaceae</i>	P	43*
<i>Fragaria ananassa</i> Duchesne*	<i>Rosaceae</i>	H	70*
<i>Hibiscus syriacus</i> L.	<i>Malvaceae</i>	P	4*, 16*, 27*, 66*
<i>Hydrangea macrophylla</i> (Thunb.) Ser.	<i>Hydrangeaceae</i>	P	27*, 69*
<i>Iberis sempervirens</i> L.	<i>Brassicaceae</i>	Ch	70*
<i>Impatiens balfourii</i> Hooker f.	<i>Balsaminaceae</i>	T	27*
<i>Lagenaria vulgaris</i> Ser.	<i>Cucurbitaceae</i>	T	16*
<i>Lavandula x intermedia</i> Emeric ex Loisel.	<i>Lamiaceae</i>	P	1, 37*, 43*, 70*
<i>Limonium sinuatum</i> (L.) Miller*	<i>Plumbaginaceae</i>	H	65*
<i>Lobularia maritima</i> (L.) Desv.	<i>Brassicaceae</i>	H	37*
<i>Petroselinum crispum</i> (Mill.) A. W. Hill	<i>Apiaceae</i>	H	27*, 31*, 37*, 49*, 49, 50*, 70*
<i>Petunia hybrida</i> Vilm.	<i>Solanaceae</i>	T	46*
<i>Phaseolus vulgaris</i> L.	<i>Fabaceae</i>	T	14*, 16*, 25, 27, 37*, 50*
<i>Philadelphus coronarius</i> L.	<i>Hydrangeaceae</i>	P	66*
<i>Photinia x fraseri</i> Dress*	<i>Rosaceae</i>	P	16*
<i>Pisum sativum</i> L. ssp. <i>sativum</i>	<i>Fabaceae</i>	T	16*, 28*, 37*, 47*, 70*
<i>Poinciana gilliesii</i> Hook.	<i>Fabaceae</i>	P	23*
<i>Portulaca grandiflora</i> Hooker	<i>Portulacaceae</i>	T	27*
<i>Prunus armeniaca</i> L.	<i>Rosaceae</i>	P	27*, 37*
<i>Prunus laurocerasus</i> L.	<i>Rosaceae</i>	P	1*, 14*, 16*, 70*
<i>Rhus typhina</i> L.	<i>Anacardiaceae</i>	P	14*, 70*
<i>Ribes rubrum</i> L.	<i>Grossulariaceae</i>	P	32*, 70*
<i>Rosmarinus officinalis</i> L.	<i>Lamiaceae</i>	P	1*, 4*, 16*, 23*, 27*, 37*, 43*, 47*, 47*, 66*
<i>Salix babylonica</i> L.	<i>Salicaceae</i>	P	28*, 69*
<i>Sedum palmeri</i> S.Watson*	<i>Crassulaceae</i>	Ch	27*
<i>Sorghum bicolor</i> (L.) Moench	<i>Poaceae</i>	T	14*, 22*
<i>Symporicarpos albus</i> (L.) S. F. Blake	<i>Caprifoliaceae</i>	P	13*
<i>Thuja orientalis</i> L.	<i>Cupressaceae</i>	P	65*
<i>Trachycarpus fortunei</i> (Hook.) H.Wendl.*	<i>Arecaceae</i>	P	1*
<i>Triticum aestivum</i> L.	<i>Poaceae</i>	T	3*, 69*
<i>Tropaeolum majus</i> L.	<i>Tropaeolaceae</i>	T	65*
<i>Tulipa gesneriana</i> L.*	<i>Liliaceae</i>	G	30*
<i>Weigela florida</i> (Bigelow) A. DC.	<i>Caprifoliaceae</i>	P	70*
<i>Wisteria sinensis</i> (Sims) Sweet	<i>Fabaceae</i>	P	14*
<i>Yucca gloriosa</i> L.	<i>Agavaceae</i>	P	22*, 46*
