Anomalije su sastavni dio medicinske prakse i susrećemo ih svakodnevno.¹ Neke anomalije su urođene i otkrivaju se već u ranoj fazi života (ukoliko su simptomatske), a postoje i one koje se otkriju slučajno kao slučajan nalaz. Prirođene anomalije srca i velikih krvnih žila nastaju u prvih 10 tjedana embrionalnog razvoja, a pojavljuju se u 1 na 120 živorođene djece. Specifični uzrok se najčešće ne može otkriti, a valja uzeti u obzir anomalije kromosoma, različite genetičke sindrome, bolesti majke, vanjske faktore ili kombinaciju istih.

Stečene anomalije nastaju kao nuspojava liječenja ili preboljena neke bolesti i vrlo često su neugodno iznenađenje u procesu liječenja. Cilj predavanja je prikaz rijetko viđenih anomalija u procesu invazivnog liječenja.

Anomalies are common in medicine and are encountered daily.¹ Some anomalies are congenital and are discovered at a young age (especially if they are symptomatic), while others are discovered by chance as an accidental finding. Congenital heart and large blood vessel anomalies occur in 1 in 120 live births and occur during the first 10 weeks of embryonic development. The precise cause is frequently unknown, and it is worthwhile to consider chromosome abnormalities, various genetic syndromes, maternal diseases, external factors, or a combination of these.

Acquired anomalies are frequently unpleasant surprises that occur as a side effect of treating or overcoming various diseases. Acquired anomalies occur as a side effect of treating or overcoming various diseases and are frequently an unwelcome surprise during the healing process. The lecture's goal is to present anomalies in the invasive treatment process that are rarely seen.
