Abstract

In recent years there has been a significant increase in digital advertising through influencers being active on many social media platforms. Budgets for influencer marketing rise yearly, and the return on investment from influencer marketing is higher than from other marketing channels. Therefore, influencer marketing is here to stay, and the pandemic has turned many customers online. Nowadays, customers most often collect information regarding products or services from influencers. The factors that may affect customers’ purchase decisions are seen in influencers’ credibility and advertising disclosure. A systematic literature review was done to provide an overview of the related influencer marketing field and the impact of advertising disclosure and source credibility on purchase intention. The terms (“Purchase intention”) and (“influencer credibility” OR “source credibility” and “advertising disclosure”) were used to collect data. The papers were reviewed to determine how influencer credibility and advertising disclosure impact customer purchase behavior. Results indicate that influencer credibility traits positively influence purchase intention, and advertisement disclosure may impact customer purchase intention differently.

Keywords: influencer marketing; influencer credibility; purchase intention; advertising disclosure

Introduction
According to Statista.com (2022), traditional advertising, such as advertising in magazines and newspapers, is experiencing negative growth rates, while digital marketing will grow above 13% in 2022, and worldwide digital marketing revenue is expected to grow to 683 billion dollars by 2026. Digital advertising includes the internet and delivering marketing messages in various formats to internet users (Statista, 2022). Since there is a growing number of social media network users worldwide (4.6 billion users or 58.4% of the total population), social platforms have become a popular way to advertise.

According to Datarreportal.com (2022), the average number of social platforms used each month is 7.5. Advertising in social media networks includes; sponsored posts (Social Media Advertising); advertisement banners like, e.g., so-called skyscrapers (Banner Advertising); advertisements within video players (Video Advertising); and paid digital classifieds (Classifieds) (Statista b, 2022).

This massive trend, impacted by digitalization, represents a huge opportunity for brand managers to incorporate influencer marketing into their long-term marketing strategies. Influencer marketing represents cheaper and faster advertising with the potential to reach many buyers quickly (Evans et al., 2017, Weismueller et al., 2020). The increasing use of social media has imposed new dynamics between followers and influencers. People on social networks constantly seek new information and play a dynamic role instead of being “passive recipients of marketing communications” (Vrontis et al., 2021). Therefore, influencer credibility representing influencer traits such as attractiveness, trustworthiness, and expertise in their endorsements will significantly influence followers’ purchase behaviour.

The scope of the paper is (1) to study and explore the importance of influencer credibility in the last ten years, (2) to analyse and explore how influencer credibility and advertising disclosure affects purchase intention, (3) to ensure a systematic review of the research literature in these fields. To achieve the set goals, up-to-date literature was analysed, which explores the field of influencer credibility, advertising disclosure, and consumer purchase intention. Therefore, to address the research scope, a systematic literature review was conducted to provide an overview of the relevant influencer credibility field. To collect data following phrases were used in the search field (“influencer credibility”) or (“source credibility”) and (“advertising disclosure,”) and (“purchase intention”).

Theoretical approach
Influencer credibility and advertising disclosure
Influencer credibility relates to people’s characteristics and how well they are perceived among followers. The construct influencer credibility derives from the source credibility model developed by Ohanian (1990) and consists of trustworthiness, attractiveness, and expertise and has been put in the context of social media (Vrontis et al., 2021) and researched whether the perceived credibility of an influencer impacts follower’s purchase intention (Fink et al., 2020) and which credibility trait is the key to impact consumer behaviour.

For example, Xiao et al. (2018) analysed other characteristics significant for being perceived as credible, such as argument quality, social influence, and issue involvement. This indicates that influencer marketing success depends on the characteristics of an influencer, context, and products (Vrontis et al., 2021). For example, knowledge, attractiveness, and relatability were the key characteristics influencing young millennials to buy cosmetic products (Hassan et al., 2021).
In reaching customers through influencer marketing, researchers have tried to illuminate the effect of advertising disclosure on consumer behaviour. Advertising disclosure relates to revealing the information to the customer that the advertised message is paid and includes “signs like ‘ad’ or ‘advertisement’ and statements such as ‘Promoted by (brand)’ or ‘Sponsored by (brand)’” (Weismueller et al., 2020, p.162). To disclose their products, influencers usually use hashtags in posts and place statements that this is a paid advertisement. The consumers (followers) to whom those messages are directed may react differently according to the persuasion knowledge model developed by Friestad and Wright (1994). The question is whether influencers are perceived as more credible if they display the sponsorship status due to unclear sponsorship status. Muller et al. (2018) found that influencer credibility, advertising disclosure, attitudes toward ads, and product utility were significant variables influencing purchase intention. Weismueller et al. 2020 found that a clear disclosure statement regarding hashtag disclosure increases source attractiveness, leading to higher purchase intention.

Overall, brand managers have to find influencers that are authentic to the brand to reach customers and impact them. Their credibility traits play a significant role in this process and how influencers disclose an advertised post.

**Purchase intention**

In today’s digital environment, many marketing strategies have been oriented toward researching the effect of electronic word-of-mouth (EWOM) on customer purchase behaviours. Purchase intention represents a buyer’s intention to purchase a certain product or service shortly (Herrando and Martín-De Hoyos, 2022, Weismueller et al. (2020). For the consumer to make a purchase decision, he has to recognize the need for a certain product or service, gather information and research the product or service, evaluate alternatives, and finally make a purchase (Mainardes and Cardoso, 2019).

There is a growing interest in the literature on whether sponsorship disclosure and the type of ad disclosure that influencer use in their posts encourages or discourages followers directly or indirectly from making a purchase intention.

According to Lee and Koo (2012), when customers think the influencer’s message is biased or not authentic to their experiences, their source credibility may decrease. This, in turn, may decrease the purchase intention of the buyer (Weismueller et al., 2020) since little is known about how advertising disclosure in the online environment affects purchase behaviour and which is the best way to advertise products through influencers; this paper will address this issue.

**Methodology**

The systematic literature review was used to summarize earlier findings in a research field. Through the first part of the search, we checked WoS and Scopus using the keywords: “Influencer credibility” and “Source credibility” to give an overall view of the influencer credibility topic in the last ten-year period and answer our first aim. This search resulted in 466 total papers (281 in WOS and 185 in Scopus), which are presented in detail in the results part.

Then in the second part, we narrowed our research to “advertising disclosure” and “purchase intention” to address our second research question and to ensure a systematic review of the research literature in these fields. We used peer-review journals cited in Scopus and WoS (SSCI and ESCI papers) to give a more detailed field analysis. Tables 1 and 2 present our search strategies in WoS (SSCI and ESCI) and Scopus from 2017 till March 2022.
Through the first part of the search, we checked WoS and Scopus using the keywords: “Influencer credibility” or “source credibility” and “advertising disclosure” and “purchase intention”. This approach resulted in 86 (78 in Scopus and 8 in WoS). In the next step, the search strategy was refined. Since influencer credibility is applied in different areas of scientific research, we decided to limit our research to papers published in English in the fields of business and social sciences and economy in Scopus and business or communication in WOS (Tables 1 and 2).

Results

The results of the first part of the research are the results using the search term “influencer credibility” or “source credibility” in databases Web of Science (WOS) and Scopus in the last ten years (from 2012- March 2022) to determine the trend in this area of research. This search resulted in 466 papers (281 in WOS and 185 in Scopus).

The results indicate that this field of interest, according to the number of published papers (Figure 1), started to increase drastically in 2019, where 2021 represents the year where the largest number of publications to date (117 papers) has been published, resulting in 32% increase over the year before.
The complete analysis of published papers analysed by document type published in WOS and Scopus can be seen in Figure 2. The most published papers were articles (77%), then conference proceedings (11%), review papers (9%), and other document types like book chapters, letters, etc. (3%).

**Figure 2**
Number of papers by document type published in the last ten years regarding influencer credibility or source credibility both in WOS and Scopus databases

Source: Authors’ work
Further analysis was done to determine which subject area is dominant in certain databases among many different areas. Figures 3 and 4 show that in WOS, the dominant research investigating influencer credibility is Communication (24%) and Business (18%). Other fields represent 6% or fewer record counts that address influencer credibility within their area of research (for example, Social Sciences Interdisciplinary, Environmental sciences, etc.), so they have been summed up.

Figure 3
Percentage of papers by subject area that was published in the last ten years regarding influencer credibility or source credibility in the WOS database

![WOS Graph](image)

Source: Authors’ work

In the Scopus database, the most represented area of research exploring influencer credibility was found in Business, Management, and Accounting (33%) and Social Sciences (22%). In comparison, other fields (43%) represent the total sum of many fields like Engineering, Decision Sciences, Psychology, etc., whose representation range is from 0.3% to 5% depending on the area.

Figure 4
Percentage of papers by subject area that was published in the last ten years regarding influencer credibility or source credibility in the Scopus database

Source: Authors’ work
When analysing the country of origin, in the WOS database, the leading country is the USA, with 121 papers published in ten years, followed by China (26 papers) and other countries. The top country of origin in the Scopus database is also the USA, with 36 papers, followed by Spain (15), India (13), Australia (10), and other countries with less than ten papers published in ten years.

After presenting the overall analysis of the influencer credibility field where an increasing trend of published papers has been recognized, in the second step, we narrowed our research to focus on advertising disclosure of influencers on social media networks and how this advertising, together with influencer’s credibility impact purchase behaviour of consumers.

In the second step of the analysis, we have included 28 papers (6 from WOS and 22 from Scopus). However, after analysing all papers, we excluded six papers that did not report on influencer credibility, advertising disclosure, or purchase intention.

The paper of Balaban and Szambolics (2022) explores users’ perceptions of the authenticity of influencers and advertising outcomes and does not include credibility or purchase intention; therefore, it is excluded. Further, Dalla-Pria and Rodríguez-de-Dios (2022) explored source type and message framing on social media influence message credibility, corporate reputation, and word-of-mouth. Gerrath and Usrey (2021) explore the influence of incentivization and self-disclosure on influencers’ credibility, so this paper is also excluded from further analysis. Djafarova and Matson (2021), since their paper do not include advertising disclosure or purchase intention. Berne-Manero and Marzo-Navarro focused on the potentially different roles played by macro and micro-influencers impacting social network users’ engagement with promoted products when it comes to preserving corporate sustainability. Also, the paper of Su et al. (2021) examines parasocial relationships (PSRs) between influencers and audiences on social media. After eliminating six papers, we represent in Table 3, the analysis of 22 papers based on the research description, the theory applied, and the key results of the research.

Source: Authors’ work

Lee and Kim (2021) found that type of disclosure (explicit vs. implicit vs. no disclosure) did not affect consumers add recognition. Also, visible advertising disclosure did not affect consumers’ negative attitudes toward the advertising. They don’t perceive the message as less credible when lowly credible celebrity posts promotional posts. The
advertising effectiveness posted by a highly credible influencer and by a lowly credibly remained the same, representing no difference in the perception of consumers regarding the influencer’s credibility. On the other hand, Shouten et al. (2020) found that advertising effectiveness depends on the type of influencer where he distinguishes between celebrity influencers (actors, famous sports players, etc.) and social media influencer who are most often anonymous but became popular on social media networks by representing themselves as experts in branding. In this study, consumers perceive social media influencers as more trustworthy than celebrities and have a more perceived similarity and wishful identification with the influencer. Only attractiveness positively affected purchase intention; however, influencer credibility traits (trustworthiness, expertise, and attractiveness) did not mediate the relation between influencer type and purchase intention. Vogel et al. (2020) analysed how clear sponsorship, ambiguous or no sponsorship disclosure affected perceptions of e-cigarette Instagram influencer posts among young people. Findings indicate that ad recognition increased when the ad was disclosed contrary to ambiguous or not disclosed. Still, the influencer credibility perceptions decreased and their intentions to involve in the posts also decreased. However, this may not affect perceptions or use of e-cigarette products because disclosures did not significantly influence brand attitudes, brand use intentions, or vaping intentions.

In the case of Fink et al. (2020), celebrity credibility enhances purchase intention among consumers by placing sponsorship disclosure of the brand. Also, brand differentiation increases the effect of celebrity credibility on the brand image but, at the same time, diminishes the effect of brand image on purchase intention. Breves et al. (2021) did not find differences in evaluations of the post between followers and non-followers when an ad was not disclosed. However, followers showed higher brand evaluations and purchase intentions when influencers disclosed an advertisement, contrary to the non-followers group. This relates to the fact that follower status (non-followers/followers) affects the parasocial relationship, source credibility, and evaluation of a sponsored post. Weismueller et al. (2020) found that when followers perceive influencers as more credible, a product endorsement will have a greater effect on them, leading to purchase intention. Further, this study analyses how different disclosure conditions (disclosure statement or disclosure hashtag) affected the credibility of the influencers. However, they found that disclosure statements and disclosure hashtags affect influencers’ attractiveness differently. Disclosure statement positively affects influencers’ attractiveness, indirectly increasing purchase intention, while hashtag disclosure decreases purchase intention. Authors explain this through transparent communication where followers in statements know that this is paid to advertise perceived as positive. In contrast, hashtag disclosure is perceived as unclear relation between influencers and brands. Contrary to the research of Weissmuller et al. (2020), Han et al. (2021) found when influencers display advertisements, compared to when the advertising disclosures are subtle, then the purchase intention declines.

**Conclusion**

Our study aimed to present the significance of influencer credibility in influencer marketing, which has increased significantly in the last decade. Further, we have
focused our search on the effect of advertising disclosure and perceived influencer credibility on purchase intention.

The results indicate that effective product endorsement may depend on the influencer type (celebrities vs. influencer), their credibility traits: attractiveness, expertise, and trustworthiness, and that purchase intention may decrease or increase depending on the advertising disclosure in posts. For example, different effects occurred in the two groups (followers and non-followers) when the ad in the post was disclosed. The first group showed higher advertising effectiveness why latter showed decreased ad effectiveness. Also, when there was a clear disclosure statement, the purchase intention increased, mediated by influencers’ credibility traits perceiving the clear statement as transparent rather than unclear. Therefore, followers don’t feel manipulated, and influencers’ credibility increases.

The trend of cutting costs for traditional advertising and investing in digital marketing (in this case, influencer marketing) increased during the pandemic, and this trend will continue to grow. Overall, incorporating influencers into a marketing strategy will become a regular part of the marketing mix. To make the best of influencer marketing, brand managers must choose which type of influencer would represent their brand in the best light. In this area authenticity of influencers will create added value to product advertisement since there have been studies that followed increasingly look for authenticity in content creation (Kreling et al., 2022) and transparency of ads (Weissmuller et al., 2020) where ad disclosure strategy (depending on the type of disclosure) represents a significant factor in influencers effectiveness which may increase or decrease followers purchase intention.
