

Multibody dynamic analysis for the steering mechanism of wheel loader

Yangmin Li

Faculty of Science and Technology, University of Macau, P.O. Box 3001, MACAU

SUMMARY

A multibody dynamics modelling of the steering mechanism of a wheel loader is developed based on Huston's method and Kane's equation. The dynamics simulation results are derived using computer program DYNOCOMBS. The research results will provide guidance and suggestions for design and analysis of the steering mechanism of wheel loader. This approach is useful for guiding practical product design considering dynamic effect.
