

Physical Processes in the Ionization Chamber

Radivoj Tasić

Institute of Nuclear Sciences "Boris Kidrič", Beograd

Numerical solutions of the ionization chamber steady state equations were applied to obtain approximate solutions of the mentioned equations. Thus obtained formulas define explicitly decrease of the ionization current in the presence of aerosols as a function of chamber geometry, ionization current, voltage supply and physical properties of aerosols. Decrease of the ionization current obtained by using the approximate solutions was in agreement with experimental data.
