

## AIMS & SCOPE

Naše more, International Journal of Maritime Science & Technology is a scientific journal published in three issues and occasionally one special issue per year.

The journal usually publishes only articles dealing with the analysis of significant technical, biotechnical and natural science problems related to maritime transport, the sea, the coast and the underwater environment and/or theoretical results that have a relation to the solution of such problems.

Articles should be conceptually sound and/or empirically data-based. Articles that provide a systematic review of the relevant literature (with an authentic, concise and critical presentation of the relevant problem by the author) will also be considered for publication.

An important aim is to strike a balance between theoretical and practical applications of research findings.

The journal deals with, but is not limited to, the following topics:

- Marine Engineering;
- Ocean engineering;
- Maritime Safety, Security and Resilience;
- Marine Biology and Environmental Protection;
- Maritime Transport, Logistics and Sustainable Development;
- Maritime education and training;
- Maritime legislation, management and organisational aspects.
